The spaces of measure preserving equivalence relations and graphs

Alexander S. Kechris

(Preliminary version; February 3, 2016)

Introduction

This paper is to a large extent a continuation of the work in [K] on the global aspects of measure preserving actions of countable groups. We define and study here natural topologies on the spaces of measure preserving equivalence relations and graphs on a standard probability space.

Here is an overview of the contents of the paper. In Section 1 we recall some basic facts about the space of closed subgroups of a Polish group which admits a (two-sided) invariant metric. In Section 2 we discuss full groups of measure preserving countable Borel equivalence relations on a standard probability space $(X, \mu)$, including a characterization of these groups among the subgroups of the group $\text{Aut}(X, \mu)$ of measure preserving automorphisms of $(X, \mu)$. In Section 3 we define a natural Polish topology on the space $S(E)$ of subequivalence relations of a measure preserving countable Borel equivalence relation $E$. Several formulations of the topology are given and shown to be equivalent. A stronger (non-separable) topology, useful in certain applications, is also discussed. In Section 4 we discuss the structure of limits of convergent sequences in $S(E)$. In Section 5 it is shown that the topologies on $S(E)$ are coherent under inclusion and can be used to define a topology on the space of all measure preserving countable Borel equivalence relations (which is however far from Polish).

In Section 6 we discuss continuity properties of the map that assigns to each measure preserving action of a countable group $\Gamma$ the associated equivalence relation and show that they are related to properties of the group such as amenability and property (T). In Sections 7, 8, 9 we include several
descriptive set theoretic complexity calculations for classes of equivalence relations in $S(E)$. This leads in Section 10 to the introduction and study of the class of richly ergodic equivalence relations $E$, i.e., those for which the generic equivalence relation in $S(E)$ is ergodic. In Section 11 we consider the cost function on the space of subequivalence relations and in Section 12 the concept of normality. In Section 13 we prove a Borel selection theorem for hyperfiniteness. In Section 14 we study the connections of the preceding theory to the structure of invariant, random equivalence relations on a countable group. Section 15 deals with ultraproducts of equivalence relations and in Section 16 we define and study various notions of factoring for equivalence relations.

In Section 17 we introduce an analogous canonical topology on the space $Gr(E)$ of Borel subgraphs of a measure preserving countable Borel equivalence relation $E$ and in Section 18 we include various descriptive complexity calculations related to this topology. Section 19 deals with the notion of treeability for equivalence relations.

Acknowledgements. Research partially supported by NSF Grants DMS-0968710 and DMS-1464475. I would like to thank Lewis Bowen for asking some questions that got me thinking about this topic. Thanks also to Lewis, Peter Burton, Ben Miller, Anush Tserunyan, Robin Tucker-Drob for many useful comments and corrections or for allowing me to include some results of theirs in this paper.

Note: This is a very preliminary version of work still in progress. It has not been carefully proofread and may contain errors. Any comments or corrections will be of course very much appreciated.

1 The space of closed subgroups

We start with some preliminaries. Fix a Polish metric space $(X,d)$, with $d \leq 1$ and let $\mathcal{F}^*(X)$ be the set of non-empty closed subsets of $X$. We can identify $F \in \mathcal{F}^*(X)$ with the distance function

$$f_F(x) = d(x,F),\ x \in X,$$

and view $\mathcal{F}^*(X)$ as a subset of $[0,1]^X$. The relative topology on $\mathcal{F}^*(X)$ induced by the product topology on $[0,1]^X$ is called the Wijsman topology on $\mathcal{F}^*(X)$. It is the topology generated by the functions:

$$F \mapsto d(x,F),\ x \in X.$$

It is shown in Beer [B] that $\overline{\mathcal{F}^*(X)}$, the closure of $\mathcal{F}^*(X)$ in $[0,1]^X$, is compact metrizable and $\mathcal{F}^*(X)$ is $G_δ$ in $\overline{\mathcal{F}^*(X)}$, thus a Polish space. Moreover the Borel $σ$-algebra of the Wijsman topology on $\mathcal{F}^*(X)$ is the Effros $σ$-algebra generated by the sets $\{F \in \mathcal{F}^*(X): F \cap V \neq \emptyset\}$, for $V \subseteq X$ open (Hess, see, e.g., [BK, 2.6.2]).

Equivalently, we can describe this topology as follows. Fix a countable dense subset $X_0 \subseteq X$. Then it is clear that this topology is also the one generated by the functions $F \mapsto d(x_0,F), x_0 \in X_0$. Then we can also identify $F \in \mathcal{F}^*(X)$ with the function

$$f_0^F(x_0) = d(x_0,F),\ x_0 \in X,$$

and view $\mathcal{F}^*(X)$ as a subset of $[0,1]^{X_0}$. The relative topology on $\mathcal{F}^*(X)$ induced by the product topology on $[0,1]^{X_0}$ is again the Wijsman topology.

Assume next that $\Gamma$ is a Polish group with a compatible (two-sided) invariant metric $d$. Then $(\Gamma,d)$ is complete, thus a Polish metric space. Let $Sg(\Gamma) = \{H \subseteq \Gamma: H$ is a closed subgroup$\}$.

**Proposition 1.1.** $Sg(\Gamma)$ is a closed subspace of $\mathcal{F}^*(\Gamma)$.

**Proof.** Let $H_n \in Sg(\Gamma)$ and $H_n \to H$. Then $d(1,H_n) = 0 \to d(1,H)$, so $d(1,H) = 0$ and $1 \in H$. Let now $g, h \in H$ in order to show that $gh^{-1} \in H$. Since $0 = d(g, H) = \lim_{n \to \infty} d(g, H_n)$, find $g_n \in H_n$ with $d(g,g_n) \to 0$ and similarly find $h_n \in H_n$ with $d(h,h_n) \to 0$. Then $d(h^{-1}, h_n^{-1}) \to 0$ (since $d(h,h_n) \to 0$ iff $h_n \to h$ iff $h_n^{-1} \to h^{-1}$ iff $d(h^{-1}, h_n^{-1}) \to 0$) and so $d(gh^{-1}, g_nh_n^{-1}) \to 0$, thus $d(gh^{-1}, H_n) \to d(gh^{-1}, H) = 0$, i.e., $gh^{-1} \in H$. □
It follows that $Sg(\Gamma)$ with the induced topology is also Polish. The group $\Gamma$ acts on $Sg(\Gamma)$ by conjugation: $g \cdot H = gHg^{-1}$.

**Proposition 1.2.** *The conjugation action of $\Gamma$ on $Sg(\Gamma)$ is continuous.*

**Proof.** It is enough to show that it is separately continuous.

(1) Let $g_n \to g$ in $\Gamma$ and $H \in Sg(\Gamma)$. We will show that $g_nHg_n^{-1} \to gHg^{-1}$, i.e., that for $x \in \Gamma$,

$$d(x, g_nHg_n^{-1}) \to d(x, gHg^{-1}).$$

Now $d(x, g_nHg_n^{-1}) = d(g_n^{-1}xg_n, H)$ and $d(x, gHg^{-1}) = d(g^{-1}xg, H)$. Since $g_n^{-1}xg_n \to g^{-1}xg$ and $|d(x, H) - d(y, H)| \leq d(x, y)$, this is clear.

(2) Let $g \in \Gamma$ and $H_n \to H$ in $Sg(\Gamma)$. We will show that $gH_ng^{-1} \to gHg^{-1}$, i.e., for any $x \in \Gamma$

$$d(x, gH_ng^{-1}) \to d(x, gHg^{-1})$$

or equivalently

$$d(g^{-1}xg, H_n) \to d(g^{-1}xg, H)$$

which is obvious. \qed
2 Full groups

Let now \((X, \mu)\) be a standard probability space (i.e., \(X\) is a standard Borel space and \(\mu\) a Borel probability measure on \(X\)). We denote by \(\text{Aut}(X, \mu)\) the group of all Borel automorphisms of \(X\) which preserve the measure \(\mu\) and in which we identify two such automorphisms if they agree \(\mu\)-a.e. \textbf{Unless otherwise stated, we will assume that \((X, \mu)\) is non-atomic. Moreover, we usually neglect null sets in the sequel.}

The \textbf{uniform metric} \(d = d_u\) on \(\text{Aut}(X, \mu)\) is defined by \(d_u(S, T) = \mu(\{x: S(x) \neq T(x)\})\). This is a (two-sided) invariant complete metric on \(\text{Aut}(X, \mu)\) and the associated \textbf{uniform topology}, \(u\), makes it a topological group.

Let now \(E\) be a measure preserving countable Borel equivalence relation on \(X\) and \(\Gamma = [E]\) the \textbf{full group} of \(E\). Then \(\Gamma\) is a closed subgroup of \(\text{Aut}(X, \mu)\) in the uniform topology and \(d\) restricted to \(\Gamma\) is separable, thus \(\Gamma\) is a Polish group admitting the compatible invariant metric \(d\).

It is an interesting question to characterize the full groups \([E]\) among the subgroups of the topological \(\text{Aut}(X, \mu)\) equipped with the uniform topology, using only the topological group structure of this group. Below we provide one such characterization. We start with the following lemma.

\textbf{Lemma 2.1.} For any non-trivial involution \(T \in \text{Aut}(X, \mu)\), the centralizer \(C_T\) of \(T\) in the group \(\text{Aut}(X, \mu)\) has a largest abelian normal subgroup, denoted by \(A_T\). Moreover if \([T]\) is the full group of the equivalence relation induced by \(T\), then \(A_T = [T]\).

\textbf{Proof.} By [K, Lemma 4.7], if \(T \in [E]\), \(E\) ergodic, then \([T]\) is the largest abelian normal subgroup of \(C_T \cap [E]\). Since \(\text{Aut}(X, \mu) = \bigcup\{[E]: E\ ergodic, T \in [E]\}\) the result follows. \(\square\)

We now have:

\textbf{Theorem 2.2.} The following are equivalent for a subgroup \(\Gamma\) of \(\text{Aut}(X, \mu)\):

(i) \(\Gamma = [E]\), for a measure preserving countable Borel equivalence relation \(E\),

(ii) (a) \(\Gamma\) is closed and separable in \((\text{Aut}(X, \mu), u)\), (b) the group generated by the involutions in \(\Gamma\) is uniformly dense in \(\Gamma\), and (c) for any nontrivial involution \(T \in \Gamma\), \(A_T \subseteq \Gamma\).
Proof. We can assume that $\Gamma$ is nontrivial. That (i) implies (ii), (a) and (c) is clear using standard properties of full groups. For (b), note that Ben Miller in his Ph. D. thesis [M1] proved that every element of $[E]$, $E$ aperiodic, is a product of involutions in $[E]$. Also any permutation of a finite set is a product of involutions. Given $\epsilon > 0$, there is $N$ and an $E$-invariant Borel set of measure at least $1 - \epsilon$ in which each $E$-class is either infinite or has cardinality at most $N$, which shows that any $T \in [E]$ can be uniformly approximated by a product of involutions.

To prove that (ii) implies (i), let $\mathcal{I}$ be a countable set of nontrivial involutions in $\Gamma$ which is uniformly dense in the set of nontrivial involutions in $\Gamma$ whose full groups are also contained in $\Gamma$ (this is nonempty by (b), (c)). Let $E$ be the equivalence relation induced by $\mathcal{I}$. The group generated by $\mathcal{I}$ is included in $[E]$ and thus so is its uniform closure, so $\Gamma \subseteq [E]$. By [KT], 4.4, the group generated by the union of the full groups $[T]$, $T \in \mathcal{I}$, is uniformly dense in $[E]$. By (c) and Lemma 2.1 this group is contained in $\Gamma$, so $\Gamma = [E]$.

Remark 2.4. In Theorem 2.3, (b) can be replaced by (b)*: $\Gamma$ is topologically simple.

Theorem 2.3. The following are equivalent for a subgroup $\Gamma$ of $\text{Aut}(X, \mu)$:
(i) $\Gamma = [E]$, for an ergodic measure preserving countable Borel equivalence relation $E$,
(ii) (a) $\Gamma$ is closed and separable in $(\text{Aut}(X, \mu), u)$, (b) $\Gamma$ is simple, and (c) $\Gamma$ contains a nontrivial involution $T$ with $A_T \subseteq \Gamma$.

Proof. For the proof that (i) implies (ii), use [K], 4.6. For the other direction, it is enough to show that $\Gamma$ is of the form $[E]$, because (b) then implies the ergodicity of $E$ (see [K, page 22]). By [KT, proof of 4.14], and using (c), we see that there is a nonempty countable set of nontrivial involutions $\mathcal{I}$ contained in $\Gamma$ such that if $E$ is the equivalence relation induced by $\mathcal{I}$, then $[E] \triangleleft \Gamma$. Since $\Gamma$ is simple and $[E]$ is nontrivial, $\Gamma = [E]$.

Remark 2.4. In Theorem 2.3, (b) can be replaced by (b)*: $\Gamma$ is topologically simple.
\( \mathcal{P}(\Gamma) \) holds. It turns out that no such “internal” characterization is possible even if one uses the metric \( d_u \) on \( \Gamma \).

**Proposition 2.5.** For each measure preserving countable Borel equivalence relation \( E \), different than equality, there is a closed separable subgroup \( G \) of \((\text{Aut}(X, \mu), u)\) which is not a full group but there is an isometry between \((G, d_u)\) and \(([E], d_u)\) which is also a group isomorphism.

**Proof.** Let \( Y = X \times \{0, 1\} \), \( \nu = \mu \times \eta \), where \( \eta \) is the uniform measure on \( \{0, 1\} \). Consider the equivalence relation \( E^* \) on \( Y \) given by

\[
(x, i)E^*(y, j) \iff xe^y \& i = j.
\]

Then \( E^* \) is a measure preserving countable Borel equivalence relation on \((Y, \nu)\), which is of course isomorphic to \((X, \mu)\). For \( T \in [E] \), let \( T^* \in [E^*] \) be defined by

\[
T^*(x, i) = (T(x), i).
\]

Then \( T \mapsto T^* \) is an isometry of \(([E], d_u)\) with \((\Gamma, d_u)\), where

\[
\Gamma = \{T^*: T \in [E]\}
\]

is a closed subgroup of \((\text{Aut}(Y, \nu), u)\), and \( T \mapsto T^* \) is also clearly a group isomorphism.

However \( \Gamma \) is not a full group. Indeed if \( \Gamma = [F] \), then \( F = E^* \), so \( \Gamma = [E^*] \). But if \( T_0 \neq T_1 \) are in \([E]\), let \( S \in [E] \) be defined by

\[
S(x, i) = (T_i(x), i).
\]

Then \( S \in [E^*] \setminus \Gamma \), a contradiction. \( \square \)
3 The space of subequivalence relations

Let $E$ be a measure preserving countable Borel equivalence relation on $(X, \mu)$. We denote by $S(E)$ the set of all subequivalence relations of $E$, where as usual we identify two such relations if they agree a.e. We will next define a canonical Polish topology on $S(E)$. In fact we will give several descriptions of this topology.

(A) The weak topology. We can identify any $F \in S(E)$ with its full group $[F]$ and thus view $S(E)$ as a subspace of $\text{Sg}([E])$.

Proposition 3.1. $S(E)$ is a closed subspace of $\text{Sg}([E])$.

Proof. Let $F_n \in S(E)$ and $[F_n] \to H \in \text{Sg}([E])$. We will show that $H \in S(E)$, i.e., that $H = [F]$, where $F$ is a subequivalence relation of $E$.

Let $H_0 \leq H$ be a countable dense subgroup of $H$. Thus $H_0 \leq [E]$ and let $F$ be the subequivalence relation of $E$ induced by $H_0$. We will show that this works.

Since $H_0 \subseteq [F]$ and $H_0$ is dense in $H$, clearly $H \subseteq [F]$.

We verify next that $[F] \subseteq H$. Fix any $T \in [F]$. Then there is a Borel decomposition $X = \bigsqcup_n A_n$ and $h_n \in H_0$ such that $T = \bigsqcup_n (h_n|A_n)$. Fix $\epsilon > 0$ and let $N$ be so large that

$$\sum_{n \geq N} \mu(A_n) < \epsilon.$$ 

Put $\varphi = \bigsqcup_{n<N} (h_n|A_n)$. Since $h_0, \ldots, h_{N-1} \in H = \lim_{n \to \infty} [F_n]$, for all large enough $N_0$ we can find $g_0, \ldots, g_{N-1} \in [F_{N_0}]$ with $d(h_n, g_n) < \frac{\epsilon}{N}$ for $n < N$. For $n < N$ let $B_n \subseteq A_n$ be such that $\mu(A_n \setminus B_n) < \frac{\epsilon}{N}$ and $h_n|B_n = g_n|B_n$. Let then $\psi = \bigsqcup_{n<N} g_n|B_n$ and note that $\psi(x)F_{N_0}x$ (for almost all $x$ in the domain of $\psi$). Let $U \in \text{Aut}(X, \mu)$ be such that $\psi \subseteq U$.

We now recall the following fact (see Ioana-Kechris-Tsankov [IKT, 1.1, 1.2]).

Proposition 3.2. Let $F$ be a measure preserving countable Borel equivalence relation and $S \in \text{Aut}(X, \mu)$. Then

$$d(S, [F]) = \mu\{x: (x, S(x)) \notin F\}$$

and there is $T \in [F]$ such that $\{x: (x, S(x)) \in F\} = \{x: S(x) = T(x)\}$, so that, in particular, $d(S, [F]) = d(S, T)$. 

10
By this result, there is $S \in [F_{N_0}]$ such that $S(x) = U(x)$ if $U(x)F_{N_0}x$. Then if $x \in B_n$, $n < N, U(x) = g_n(x)F_{N_0}x$, so $\psi \subseteq S$.

Now $S, T$ agree except on a set of measure $< N\frac{\epsilon}{N} + \epsilon$, so $d(S, T) < 2\epsilon$ and thus $d(T, [F_{N_0}]) < 2\epsilon$. Thus we have shown that if $T \in [F]$, then we can find $N_1 < N_2 < \ldots$ such that $d(T, [F_{N_i}]) < \frac{1}{i}$, so $d(T, H) = 0$, i.e., $T \in H$. □

Below we put $d(S, F) = d(S, [F]).$

From Proposition 3.1, we have that $S(E)$ is also a Polish space with the topology it inherits from $\text{Sg}([E])$. We call this the weak topology on $S(E)$ and denote it by $w$. We recall that in this topology

$$F_n \xrightarrow{w} F \text{ iff } \forall S \in [E](d(S, F_n) \to d(S, F)).$$

Moreover $[E]$ can be replaced in this equivalence by any dense subset of $[E]$. The group $[E]$ acts on $S(E)$ by

$$x(T \cdot F)y \iff T^{-1}(x)FT^{-1}(y)$$

and, since $[T \cdot F] = T[F]T^{-1}$, Proposition 1.2 shows that this action is continuous. It is clear that this action is not minimal, since $E$ is a fixed point of the action. However the following is an open problem:

**Problem 3.3.** Is there a dense orbit for the action of $[E]$ on $S(E)$?

Consider now an aperiodic $E$ and the group $N(E)$ with its associated Polish topology (see [K, Section 6]). Clearly $N(E)$ also acts on $S(E)$ by the formula:

$$x(T \cdot F)y \iff T^{-1}(x)FT^{-1}(y).$$

**Proposition 3.4.** If $E$ is aperiodic, then the action of $N(E)$ on $S(E)$ is continuous.

**Proof.** It is enough to check separate continuity. Below the superscripts on the arrows indicate the spaces in which these limits are taken.

(i) $F_n \xrightarrow{w} F \implies T \cdot F_n \xrightarrow{w} T \cdot F$: This is equivalent to

$$F_n \xrightarrow{w} F \implies d(T^{-1}ST, F_n) \to d(T^{-1}ST, F)$$

for $S \in [E]$, which is clear as $T^{-1}ST \in [E]$. 11
\[(ii) \ T_n \xrightarrow{N(E)} T \Rightarrow T_n \cdot F \xrightarrow{w} T \cdot F: \text{ Fix } S \in [E] \text{ in order to show that} \]
\[d(S, T_n \cdot F) \to d(S, T \cdot F).\]

This is equivalent to
\[d(T_n^{-1}ST_n, F) \to d(T^{-1}ST, F).\]

But \(T_n \xrightarrow{N(E)} T\) implies that \(T_n^{-1}ST_n \xrightarrow{[E]} T^{-1}ST\), so this is clear. \(\square\)

We also do not know if there is a dense orbit for the action of \(N(E)\) on \(S(E)\).

We finally note, for further reference, the following simple fact:

**Proposition 3.5.** Let \(F_0 \subseteq F_1 \subseteq \ldots \) be in \(S(E)\) and let \(F = \bigcup_n F_n\). Then \(F_n \xrightarrow{w} F\). Similarly, if \(F_0 \supseteq F_1 \supseteq F_2 \ldots \) and \(F = \bigcap_n F_n\).

**Proof.** This is immediate from Proposition 3.2. \(\square\)

**(B) The strong topology.** We now define another topology on \(S(E)\).

**Definition 3.6.** Let \(E\) be a countable Borel equivalence relation on \(X\). A sequence \((T_i)_{i \in \mathbb{N}}\) of Borel automorphisms is called **generating** for \(E\) if
\[T_i(x)Ex, \text{ for all } x, i,\]
and if \(x \neq y, xEy\), then there is \(i\) such that \(y = T_i(x)\).

Such generating sequences exist by the Feldman-Moore Theorem. In fact one can see the following stronger version, where we call a generating sequence \((T_i)_{i \in \mathbb{N}}\) for \(E\) a **uniquely generating sequence** if for all \(x \neq y, xEy\), there is a unique \(i\) such that \(y = T_i(x)\). The following is a special case of [KST, 4.10] but we include a proof for completeness.

**Proposition 3.7.** Let \(E\) be a countable Borel equivalence relation on \(X\). Then there is a uniquely generating sequence \((T_i)_{i \in \mathbb{N}}\) for \(E\) consisting of Borel involutions of \(X\).
Proof. The proof of the Feldman-Moore theorem gives a sequence \( \{S_j\}_{j \in \mathbb{N}} \) of Borel involutions such that \( x Ey \iff \exists j(S_j(x) = y) \). For each \( j \), let \( \text{supp}(S_j) = \{x : S_j(x) \neq x\} \). Now let \( Y_i = \{x : \forall j < i(S_i(x) \neq S_j(x))\} \). If \( x \in Y_i \), then \( S_i(x) \in Y_i \), since otherwise there is \( j < i \) with \( x = S_i(S_i(x)) = S_j(S_i(x)) \), so \( S_j(x) = S_i(x) \), a contradiction. Thus if we let \( T_i = S_i|Y_i \cup \text{id}|(X \setminus Y_i) \), \( T_i \) is an involution and clearly \( T_i(x)Ex \). Let \( i \) be least such that \( S_i(x) = y \). We claim that \( x \in Y_i \), thus \( T_i(x) = y \). Otherwise, for some \( j < i \), \( S_i(x) = S_j(x) = y \) a contradiction. Finally assume that \( y = T_i(x) = T_j(x) \) with \( j < i \), towards a contradiction. Since \( x \neq y \) this means that \( x \in \text{supp}(T_j) \), so \( y = S_j(x) \), a contradiction. \( \square \)

**Definition 3.8.** Consider the space \( S(E) \) and for \( T \in [E], F \in S(E) \) let

\[
A_{T,F} = \{x : (x, T(x)) \in F\}.
\]

Fix a generating sequence \((T_i)_{i \in \mathbb{N}}\) for \( E \) and consider the map

\[
F \mapsto (A_{T_i,F})_{i \in \mathbb{N}} \in \text{MALG}^\mathbb{N}
\]

(where \( \text{MALG} = \text{MALG}_\mu \) is the measure algebra of \((X, \mu)\)).

**Lemma 3.9.** The map \( A \mapsto (A_{T_i,F})_{i \in \mathbb{N}} \) is 1-1.

**Proof.** Assume \( F, G \in S(E) \) and \( A_{T_i,F} = A_{T_i,G} \) for all \( i \). Then for \( x \neq y \), \( (x, y) \in F \iff \exists i(y = T_i(x) \& x \in A_{T_i,F}) \iff (x, y) \in G \). \( \square \)

Thus we can identify \( F \) with \((A_{T_i,F})_{i \in \mathbb{N}}\) and transfer the product topology on \( \text{MALG}^\mathbb{N} \) to \( S(E) \) to get a separable, metrizable topology on \( S(E) \), which we will call the **strong topology** on \( S(E) \), Thus

\[
F_n \xrightarrow{s} F \iff \forall i(A_{T_i,F_n} \xrightarrow{\text{MALG}} A_{T_i,F}).
\]

We next note that this topology is independent of the choice of \((T_i)_{i \in \mathbb{N}}\).

**Proposition 3.10.**

\[
F_n \xrightarrow{s} F \iff \forall T \in [E](A_{T,F_n} \xrightarrow{\text{MALG}} A_{T,F}).
\]
Proof. $\Leftarrow$ is obvious.

$\Rightarrow$ Assume $F_n \xrightarrow{s} F$ and let $T \in [E]$. Let $A_\infty = \{x: T(x) = x\}$ and let $A_i$ be a Borel partition of $X \setminus A_\infty$ such that $x \in A_i \Rightarrow T(x) = T_i(x)$, i.e., $X = \bigsqcup_{i=0}^{\infty} A_i \cup A_\infty$ and $T|A_i = T_i|A_i$. Fix now $\epsilon > 0$ and choose $N$ large enough so that $\sum_{i \geq N} \mu(A_i) < \epsilon$. Then choose $M$ large enough so that for any $n \geq M$ and any $i < N$,

$$\mu(A_{T_i,F_n} \Delta A_{T_i,F}) < \frac{\epsilon}{N}.$$ 

Now

$$A_{T,F_n} = \{x: (x, T(x)) \in F_n\}$$

$$= A_\infty \cup \bigsqcup_{i \in N} (A_i \cap \{x: (x, T(x)) \in F_n\})$$

$$= A_\infty \cup \bigsqcup_{i < N} (A_i \cap A_{T_i,F_n}) \cup C_n,$$

where $\mu(C_n) < \epsilon$. Similarly

$$A_{T,F} = A_\infty \cup \bigsqcup_{i < N} (A_i \cap A_{T,F}) \cup C,$$

$$= A_\infty \cup \bigsqcup_{i < N} (A_i \cap A_{T_i,F}) \cup C$$

where $\mu(C) < \epsilon$. Therefore

$$(A_{T,F_n} \Delta A_{T,F}) \subseteq (\bigsqcup_{i < N} (A_i \cap A_{T_i,F}) \Delta \bigsqcup_{i < N} (A_i \cap A_{T_i,F_n}) \cup C \cup C_n$$

$$= (\bigsqcup_{i < N} (A_i \cap (A_{T_i,F} \Delta A_{T_i,F_n}) \cup C \cup C_n,$$

thus

$$\mu(A_{T,F_n} \Delta A_{T,F}) \leq \sum_{i < N} \mu(A_{T_i,F} \Delta A_{T_i,F_n}) + 2\epsilon \leq 3\epsilon$$

We will next show that the strong topology on $S(E)$ is Polish. Before we do that however we state the following elementary lemma that will be also useful later on. Its proof is straightforward, so we omit it.
Lemma 3.11. Let $\Gamma$ be a group, $a : \Gamma \times X \to X$ an action of $\Gamma$ on a set $X$ and put $a(g, x) = g \cdot x$. Let $E_a$ be the induced equivalence relation on $X$ and let $F \subseteq E_a$ be a subequivalence relation. For $g \in \Gamma$, let

$$A^a_{g,F} = A_{g,F} = \{ x : (x, g \cdot x) \in F \}.$$  

Then

1. $A_{1,F} = X$,  
2. $A_{g,F} \subseteq g^{-1} : A_{g^{-1},F}$,  
3. $A_{g,F} \cap g^{-1} : A_{h,F} \subseteq A_{hg,F}$,  
4. $A_{h,F} \cap \text{Fix}(h^{-1}g) \subseteq A_{g,F}$,

where

$$\text{Fix}(p) = \{ x : p \cdot x = x \}.$$  

Conversely, if $(A_g)_{g \in \Gamma}$ is a family of sets satisfying 1.-3. above, then the relation

$$xFy \iff \exists g(g \cdot x = y \lor x \in A_g)$$  

defines a subequivalence relation of $E_a$ and if 4. also holds we have that $A_g = A_{g,F}$.

Theorem 3.12. The strong topology on $S(E)$ is Polish.

Proof. Proposition 3.10 shows that the strong topology does not depend on which generating sequence we use. So fix a Borel action of a countable group $\Gamma$ generating $E$ and for each group element $g$ denote also by $g$ the automorphism of the space $X$ induced by the action of $g$. Since the strong topology is obtained by transferring to $S(E)$ the relative topology (in $\text{MALG}^{\Gamma}$) of the range of the map

$$F \mapsto (A_g,F)_{g \in \Gamma},$$

it is enough to show that the range of this map is closed in $\text{MALG}^{\Gamma}$. This means that we have to show that if $F_n \in S(E)$ and for each $g$, $A_{g,F_n} \xrightarrow{\text{MALG}} A_g$ as $n \to \infty$, then there is $F \in S(E)$ with $A_{g,F} = A_g$.

Since, for each $n$, the family $(A_{g,F_n})_{g \in \Gamma}$ satisfies (a.e.) conditions 1.-4. of Lemma 3.11, it follows, by taking limits, that so does the family $(A_g)_{g \in \Gamma}$, and then, by Lemma 3.11 again, there is $F \in S(E)$ such that $A_{g,F} = A_g$. $\square$
An alternative description of the strong topology on $S(E)$ is as follows:

First consider $\text{MALG}$ and let $\mathcal{D} \subseteq \text{MALG}$ be a countable dense subset of $\text{MALG}$. Then the map

$$A \in \text{MALG} \mapsto \{\mu(A \cap D)\}_{D \in \mathcal{D}} \in [0,1]^\mathcal{D}$$

is 1-1. Because if $A, B \in \text{MALG}$ are distinct, then either $\mu(A \setminus B) > 0$ or $\mu(B \setminus A) > 0$. Say $a = \mu(A \setminus B) > 0$. Let $D \in \mathcal{D}$ be such $\mu((A \setminus B) \Delta D) < a/2$. Then $\mu(D \cap A) \geq \mu(D \cap (A \setminus B)) = a - \mu((A \setminus B) \setminus D) > a/2$, while $\mu(D \cap B) \leq \mu((D \cap (X \setminus A)) \cup (D \cap B)) = \mu(D \setminus (A \setminus B)) < a/2$, so $\mu(A \cap D) \neq \mu(B \cap D)$. Thus we can identify $\text{MALG}$ with the range of this map and transfer to $\text{MALG}$ the relative topology from $[0,1]^\mathcal{D}$ (with the product topology). We can now see that this topology is the same as the topology of $\text{MALG}$. This follows from the next proposition.

**Proposition 3.13.** The following are equivalent:

(i) $A_n \xrightarrow{\text{MALG}} A$,

(ii) $\forall B \in \text{MALG}(\mu(B \cap A_n) \to \mu(B \cap A))$,

(iii) $\forall D \in \mathcal{D}(\mu(D \cap A_n) \to \mu(D \cap A))$.

**Proof.** Clearly (i) $\Rightarrow$ (ii) $\Rightarrow$ (iii). To see that (ii) $\Rightarrow$ (i), take in (ii) $B = A$ and $B = X \setminus A$. Finally for (iii) $\Rightarrow$ (ii), fix $B \in \text{MALG}$ and $\epsilon > 0$. Then let $D \in \mathcal{D}$ be such that $\mu(D \Delta B) < \epsilon$. Choose next $N$ such that for $n \geq N$ we have $|\mu(D \cap A_n) - \mu(D \cap A)| \leq \epsilon$. Then for such $n$, $|\mu(B \cap A_n) - \mu(B \cap A)| \leq |\mu(B \cap A_n) - \mu(D \cap A_n)| + |\mu(D \cap A_n) - \mu(D \cap A)| + |\mu(D \cap A) - \mu(B \cap A)| < 2\mu(D \Delta B) + \epsilon < 3\epsilon$. \qed

From this it follows that if $(T_i)_{i \in \mathbb{N}}$ is a generating sequence for $E$ and $\mathcal{D}$ is a dense subset of $\text{MALG}$,

$$F_n \xrightarrow{\text{w}} F \iff \forall i \in \mathbb{N}\forall D \in \mathcal{D}(\mu(A_{T_i,F_n} \cap D) \to \mu(A_{T_i,F} \cap D))$$

$$\iff \forall T \in [E]\forall D \in \mathcal{D}(\mu(A_{T,F_n} \cap D) \to \mu(A_{T,F} \cap D))$$

$$\iff \forall T \in [E]\forall B \in \text{MALG}(\mu(A_{T,F_n} \cap B) \to \mu(A_{T,F} \cap B)).$$

For comparison we note that

$$F_n \xrightarrow{\text{w}} F \iff \forall T \in [E](\mu(A_{T,F_n}) \to \mu(A_{T,F})).$$
Moreover in all these equivalences we can replace \([E]\) by any dense subset of \([E]\).

(C) **Identification of the topologies.** We next show that the two topologies we introduced are the same.

**Theorem 3.14.** The weak topology on \(S(E)\) is equal to the strong topology on \(S(E)\).

**Proof.** Clearly the weak topology is contained in the strong topology, so it is enough to show that if \(F_n, F \in S(E)\) and \(F_n \overset{w}{\to} F\), then \(F_n \overset{s}{\to} F\).

Fix \(T \in [E]\) in order to show that \(\mu(A_{T,F_n} \triangle A_{T,F}) \to 0\). By Proposition 3.2, let \(S \in [F]\) be such that \((x,T(x)) \in F \iff S(x) = T(x)\). The rest of the argument is due to Anush Tserunyan. My original proof was more complicated.

We have \(\mu(A_{T,F} \setminus A_{T,F_n}) = \mu(\{x \in A_{T,F}: (x,T(x)) \notin F_n\}) = \mu(\{x \in A_{T,F}: (x,S(x)) \notin F_n\}) \leq d(S,F_n) \to 0\).

Also \(\mu(A_{T,F_n} \setminus A_{T,F}) - \mu(A_{T,F} \setminus A_{T,F_n}) = (\mu(A_{T,F_n} \setminus A_{T,F}) + \mu(A_{T,F_n} \cap \mu(A_{T,F})) - (\mu(A_{T,F} \cap A_{T,F_n}) + \mu(A_{T,F} \setminus A_{T,F_n})) = \mu(A_{T,F_n}) - \mu(A_{T,F}) \to 0\), and hence \(\mu(A_{T,F_n} \setminus A_{T,F}) \to 0\), so \(\mu(A_{T,F_n} \triangle A_{T,F}) \to 0\). 

**Remark 3.15** (A. Tserunyan). Note that in the proof of Theorem 3.14 we only needed to verify that \(F_n \overset{w}{\to} F \implies \forall i(\mu(A_{T_i,F_n} \triangle A_{T_i,F}) \to 0)\), for a sequence of involutions \((T_i)_{i \in \mathbb{N}}\) generating \(E\). For an involution \(T\), it is obvious how to find \(S \in [F]\) such that \(S(x) = T(x)\), whenever \((x,T(x)) \in F\). One simply defines \(A = \{x: (x,T(x)) \in F\}\) and, noting that \(A\) is \(T\)-invariant, let \(S(x) = T(x)\), if \(x \in A\), and \(S(x) = x\), if \(x \notin A\).

From now on we will call this topology simply the **topology** of \(S(E)\). Note that we also have the following characterization of convergence in this topology.

Let \(((E))\) be the set of Borel maps \(\varphi: A \to B\), with \(A, B\) Borel subsets of \(X\), such that \(x \in A \Rightarrow \varphi(x) \in x\). For \(\varphi \in ((E)), F \in S(E)\), let

\[
A_{\varphi,F} = \{x \in \text{dom}(\varphi): (x,\varphi(x)) \in F\}.
\]

Then for \(F_n, F \in S(E)\):

\[
F_n \overset{s}{\to} F \iff \forall \varphi \in ((E)) (\mu(A_{\varphi,F_n}) \to \mu(A_{\varphi,F}))
\]

\[
\iff \forall \varphi \in ((E)) (A_{\varphi,F_n} \overset{\text{MALG}}{\to} A_{\varphi,F}).
\]
This is because if $\varphi \in ((E))$ and $(T_i)$ is such that $xEy \iff \exists i(y = T_i(x))$, then there is a Borel decomposition $\text{dom}(\varphi) = \bigcup A_i$ such that $x \in A_i \Rightarrow \varphi(x) = T_i(x)$. Then if $F_n \to F$, we have $\mu(A_{\varphi,F_n} \triangle A_{\varphi,F}) = \sum_i \mu(A_i \cap (A_{T_i,F_n} \triangle A_{T_i,F})) \to 0$, as $n \to \infty$.

Remark 3.16. One can also consider the topology on $S(E)$ induced by the complete metric

$$\sigma(F_1, F_2) = \mu(\{ x : [x]_{F_1} \neq [x]_{F_2} \})$$

(see [CM1, Appendix J]). This is stronger than the topology of $S(E)$. If $F \in S(E)$ is ergodic, then $\sigma(F, F') = 1$ for each $F' \neq F$, so every ergodic subequivalence relation of $E$ is an isolated point in this metric, which is therefore not separable for any ergodic $E$. However it is shown in [CM1, Proposition J.4] that it is separable when restricted to the finite subequivalence relations of $E$.

(D) Alternative descriptions. We discuss here three more equivalent descriptions of the topology of $S(E)$.

1. If $Y$ is a standard Borel space and $\nu, \rho$ are Borel probability measures on $Y$ that are equivalent, i.e., have the same null sets, then $\text{MALG}_\nu = \text{MALG}_\rho$. The measure $\nu$ induces the usual Polish metric $\delta_\nu(A, B) = \nu(A \triangle B)$ on $\text{MALG}_\nu$ and similarly for $\rho$. Since $\nu$ is equivalent to $\rho$, these two metrics are equivalent, i.e., induce the same topology. In particular, if $\Sigma$ is a $\sigma$-finite Borel measure on $Y$ one can define unambiguously a Polish topology on $\text{MALG}_\Sigma = \text{MALG}_\nu$, for any Borel probability measure $\nu$ equivalent to $\Sigma$, e.g., $\nu = \sum_{n=0}^{\infty} \frac{1}{2^n}(\Sigma_{Y_n})$, where $Y = \bigsqcup_n Y_n$ is a Borel decomposition of $Y$ into sets of positive finite $\Sigma$-measure and $\Sigma_{Y_n}$ is the normalized restriction of $\Sigma$ to $Y_n$.

The set $E \subseteq X^2$ admits a Borel measure $M$ defined by

$$M(W) = \int |W_x|d\mu(x) = \int |W^y|d\mu(y)$$

for Borel $W \subseteq E$. This measure is $\sigma$-finite. We call the measure algebra of $M$, the measure algebra of $E$, in symbols $\text{MALG}_E$. (Thus $\text{MALG}_E = \text{MALG}_M$.)

Fix a sequence $(T_i)_{i \in \mathbb{N}}$ in $[E]$, such that $xEy \iff \exists i(T_i(x) = y)$. Note that $M(\text{graph}(T_i)) = 1$. Define next the Borel probability measure $\nu = \nu_{(T_i)}$ on
\(E\) by

\[
\nu(W) = \sum_{i=0}^{\infty} \frac{1}{2^{i+1}} \nu(W \cap \text{graph}(T_i)).
\]

\[
= \sum_{i=0}^{\infty} \frac{1}{2^{i+1}} \mu(A_{T_i,W})
\]

where for \(T \in [E], W \subseteq E:\)

\[
A_{T,W} = \{x: (x, T(x)) \in W\}.
\]

This is equivalent to \(M\) and the metric

\[
\delta_\nu(W,V) = \nu(W \Delta V).
\]

gives the topology of \(\text{MALG}_E = \text{MALG}_\nu\). In this topology

\[
W_n \to W \iff \forall i(A_{T_i,W_n} \xrightarrow{\text{MALG}} A_{T_i,W}).
\]

It is clear that \(S(E) \subseteq \text{MALG}_E\) and the topology of \(S(E)\) is the induced topology from \(\text{MALG}_E\). Also as in the proof of Theorem 3.12, \(S(E)\) is a closed set in the topology of \(\text{MALG}_E\). Thus we can view \(S(E)\) as a closed subspace of \(\text{MALG}_E\).

We next note a selection property of this representation of \(S(E)\). Below we view \(E\) as a genuine countable Borel equivalence relation on \(X\) and not one viewed \(\mu\)-a.e. The measure \(\nu\) as above is a non-atomic probability measure on \(E\) and therefore there is a Borel bijection \(\theta: E \to (0,1)\), which takes \(\nu\) to the Lebesgue measure \(\lambda\) on \((0,1)\). For any \(A \in \text{MALG}_\lambda\), let \(\varphi(A) = \{x \in (0,1): x\ is\ a\ density\ point\ of\ A\}\). Then \(\varphi(A)\) is a Borel subset of \((0,1)\) which represents \(A\) in the measure algebra \(\text{MALG}_\lambda\). So for each \(F \in S(E)\), let

\[
\psi(F) = \theta^{-1}(\varphi(\theta(F))).
\]

Then \(\psi(F)\) represents \(F\) in the measure algebra \(\text{MALG}_\nu\). Let \(\tilde{F}\) be a Borel subequivalence relation of \(E\) that represents \(F\) in the measure algebra \(\text{MALG}_\nu\). Then \(\nu(\tilde{F} \Delta \psi(F)) = 0\), so there is a Borel \(E\)-invariant set \(L \subseteq X\) with \(\mu(L) = 1\) and for \(x, y \in L, (x, y) \in \tilde{F} \iff (x, y) \in \psi(F)\). Let

\[
B = \{x \in X: \psi(F)\langle[x]_E\ is\ an\ equivalence\ relation\}\}.
\]
Then $\mu(B) = 1$ and $B$ is $E$-invariant Borel. Let $F^\circ = (\psi(F)|B) \cup \{(x,x) : x \not\in B\}$. Then $F^\circ$ is a Borel subequivalence relation of $E$ and $F^\circ$ represents $F$ in $\text{MALG}_\nu$. In fact a simple calculation shows that $F^\circ$ has a uniform Borel definition from $F$, i.e., we have the following:

**Proposition 3.17.** There is a Borel set $R \subseteq S(E) \times E$ such that for any $F \in S(E)$, the section $R_F = F^\circ$ is a Borel subequivalence relation of $E$ which represents $F$ in the measure algebra $\text{MALG}_\nu$, i.e., $F^\circ$ is equal to $F$ in $S(E)$.

We can also use this result to formulate a “uniform Borel version” of the Ergodic Decomposition Theorem for elements of $S(E)$.

First recall the **Ergodic Decomposition Theorem** of Farrell and (independently) Varadarajan, where again below $F$ is viewed as a genuine countable Borel equivalence relation on $X$.

**Theorem 3.18** (Farrell [F], Varadarajan [V]). Let $F$ be a countable Borel equivalence relation on a standard Borel space $X$. Then

$$\mathcal{EI}_F = \{\sigma \in P(X) : \sigma \text{ is invariant, ergodic for } F\}$$

is a Borel set in the standard Borel space $P(X)$ of probability measures on $X$ and if $F$ admits an invariant probability Borel measure, then $\mathcal{EI}_F \neq \emptyset$, and there is a Borel surjection $\pi : X \to \mathcal{EI}_F$ such that

1. $\pi$ is $F$-invariant,

2. if $X_e = \{x : \pi(x) = e\}$, then $e(X_e) = 1$ and $F|X_e$ has a unique invariant measure, namely $e$,

3. if $\mu \in P(X)$ is invariant for $F$, then $\mu = \int \pi(x) \, d\mu(x)$.

Moreover, $\pi$ is uniquely determined in the sense that, if $\pi'$ is another such map, then $\{x : \pi(x) \neq \pi'(x)\}$ is null with respect to all invariant measures for $F$.

The proof of this result is effective and therefore, in combination with Proposition 3.17, shows the following:

**Theorem 3.19.** Let $E, R, F \mapsto F^\circ$ be as in Proposition 3.17. Let $Q \subseteq S(E) \times P(X)$ be defined by

$$(F, \sigma) \in Q \iff \sigma \in \mathcal{EI}_{F^\circ}.$$
Then $Q$ is Borel, nonempty and there is a Borel set $R \subseteq S(E) \times X \times P(X)$ such that for each $F \in S(E)$, the section $R_F \subseteq X \times P(X)$ is the graph of a (Borel) function $\pi_F$ which is an ergodic decomposition for $F^\circ$ as in Theorem 3.18.

(2) The next description is due to Robin Tucker-Drob and the author. It is motivated by the idea of measurable subgroups, see [Bo, Section 4].

First, without loss of generality, we can assume that $X = 2^\mathbb{N}$ and $E$ is generated by a continuous action of a countable group $\Gamma$.

For $x \in X, F \in S(E)$, define $\Gamma^F_x = \{g \in \Gamma: (x, g^{-1} \cdot x) \in F\}$. Then $\Gamma^F_x \in \mathcal{P}_1(\Gamma) = \{a \subseteq \Gamma: 1 \in a\}$. For $g \in \Gamma, a \in \mathcal{P}_1(\Gamma)$, let $ga = \{gh: h \in a\}$.

Put $\varphi_F(x) = (x, \Gamma^F_x) \in X \times \mathcal{P}_1(\Gamma)$.

On $X \times \mathcal{P}_1(\Gamma)$ put $(x, a)R(y, b) \iff \exists g \in a^{-1}(g \cdot x = y & ga = b)$.

**Proposition 3.20.** $R$ is an equivalence relation.

**Proof.** (i) $(x, a)R(x, a)$ (take $g = 1$).

(ii) Assume $(x, a)R(y, b)$ and let $g \in a^{-1}$ be such that $g \cdot x = y$ and $ga = b$. Then $g^{-1} \in b^{-1}$ (as $1 \in a$) and $g^{-1} \cdot y = x, g^{-1}b = a$, so $(y, b)R(x, a)$.

(iii) Assume $(x, a)R(y, b)R(z, c)$ and let $g \in a^{-1}, ga = b, g \cdot x = y, h \in b^{-1}, h \cdot y = z$, so $hg \cdot x = z$. Also $g \in b, hga = c$ and $h \in (ga)^{-1} = a^{-1}g^{-1}$, thus $hg \in a^{-1}$, so $(x, a)R(z, c)$. □

**Proposition 3.21.** $\varphi_F: X \to X \times \mathcal{P}_1(\Gamma)$ is 1-1.

**Proof.** This is obvious. □

**Proposition 3.22.** $\varphi_F(X)$ is $R$-invariant.

**Proof.** Let $(x, \Gamma^F_x)R(y, b)$ and let $g \in (\Gamma^F_x)^{-1}$ be such that $g \cdot x = y, g\Gamma^F_x = b$. So $(x, g \cdot x) \in F$, thus $(x, y) \in F$. Now $\Gamma^F_y = \{h: (y, h^{-1} \cdot y) \in F\} = \{h: (y, h^{-1}g \cdot x) \in F\} = \{h: (x, h^{-1}g \cdot x) \in F\} = \{gp: (x, p^{-1} \cdot x) \in F\} = g\{p: (x, p^{-1} \cdot x) \in F\} = g\Gamma^F_x = b$, so $(y, b) = \varphi_F(y)$. □

**Proposition 3.23.** $xFy \iff \varphi_F(x)R\varphi_F(y)$. 21
Proof. ⇒ Let $x F y$ and say $y = g \cdot x$, so that $g \in (\Gamma^F_y)^{-1}$. Now we claim that $g \Gamma^F_x = \Gamma^F_y$, which follows as in Proposition 3.22.

⇐ Let $g \in (\Gamma^F_x)^{-1}$ be such that $g \cdot x = y$. Then $g^{-1} \in \Gamma^F_y$, so $(x, g \cdot x) = (x, y) \in F$.

Since $\mu$ is $F$-invariant and $\varphi_F$ is a Borel bijection between $X$ and a Borel $R$-invariant subset of $Y$, it follows that $(\varphi_F)_* \mu = \mu_F$ is an $R$-invariant probability measure on $X \times \mathcal{P}_1(\Gamma)$.

Remark 3.24. Actually the definition of $\varphi_F, F \in S(E)$, depends on picking an a.e. representative for $F$ but it is easy to check that $\mu_F$ is well defined.

Let $\mathcal{M}$ be the compact, metrizable space of probability measures on the compact zero-dimensional space $Y = X \times \mathcal{P}_1(\Gamma) \subseteq X \times \mathcal{P}(\Gamma)$, where $\mathcal{P}(\Gamma) = \{a: a \subseteq \Gamma\}$ (we identify of course here $\mathcal{P}(\Gamma)$ with the product space $2^\Gamma$). For further reference we also note the following.

Proposition 3.25. \{\mu \in \mathcal{M}: \mu \text{ is } R\text{-invariant}\} is closed in $\mathcal{M}$.

Proof. For $g \in \Gamma$, let $N_g = \{(x, a) \in Y: g \in a^{-1}\}$, a clopen subset of $Y$. Let $\Gamma$ act on $X \times \mathcal{P}(\Gamma)$ by $g \cdot (x, a) = (g \cdot x, ga)$. Of course $Y$ is not invariant under this action but note that $g \cdot N_g \subseteq Y$. It is enough to show for $\mu \in \mathcal{M}$ the following:

Claim. $\mu$ is $R$-invariant $\iff \forall g \forall$ clopen $N \subseteq N_g(\mu(N) = \mu(g \cdot N))$.

Granting this claim, it is clear that \{\mu \in \mathcal{M}: \mu \text{ is } R\text{-invariant}\} is closed in $\mathcal{M}$.

Proof of the claim. ⇒ Fix $N \subseteq N_g, N$ clopen. Then $N \ni t \mapsto g \cdot t$ is in $[[R]]$, so $\mu(N) = \mu(g \cdot N)$ follows.

⇐ Let $\varphi: A \rightarrow B$ be in $[[R]]$, in order to show that $\mu(A) = \mu(\varphi(A))$.

Now $\varphi = \bigsqcup_{g \in \Gamma} \varphi_g, \varphi_g: A_g \rightarrow B_g, A = \bigsqcup_{g \in \Gamma} A_g, B = \bigsqcup_{g \in \Gamma} B_g, A_g, B_g$ Borel and $A_g \subseteq N_g, \varphi_g(y) = g \cdot y$ for $y \in A_g$. It is thus enough to show that $\mu(B_g) = \mu(A_g)$. Since $A_g \subseteq N_g$, it is enough to show that for every Borel set $A \subseteq N_g, \mu(A) = \mu(g \cdot A)$. Let $\mathcal{B} = \{A \subseteq N_g: A \text{ is Borel and } \mu(A) = \mu(g \cdot A)\}$. By hypothesis $\mathcal{B}$ contains the algebra of clopen sets contained in (the clopen set) $N_g$ and clearly $\mathcal{B}$ is closed under relative complementation in $N_g$ and under countable disjoint unions, so $\mathcal{B}$ contains all the Borel subsets of $N_g$. \qed

Define now $\Phi: S(E) \rightarrow \mathcal{M}$ by $\Phi(F) = \mu_F = (\varphi_F)_* \mu$.
Theorem 3.26. The map $\Phi: S(E) \to M$ is a homeomorphism of $S(E)$ with a (necessarily) $G_\delta$ subspace of $M$.

Proof. (a) $\Phi$ is continuous: It is enough to show that for each clopen rectangle $U \times V$ in $Y = X \times P_1(\Gamma)$, the function

$$F \in S(E) \mapsto (\varphi_F)_*\mu(U \times V)$$

is continuous. Now $V$ is a finite disjoint union of sets of the form

$$W = \{ a \in P_1(\Gamma): g_1^{-1} \in a \& \ldots \& g_n^{-1} \in a \& h_1^{-1} \notin a \& \ldots \& h_m^{-1} \notin a \}$$

for $g_i, h_j \in \Gamma$, so it is enough to show that

$$F \in S(E) \mapsto (\varphi_F)_*\mu(U \times W)$$

is continuous. We have

$$(\varphi_F)_*\mu(U \times W) = \mu(\varphi_F^{-1}(U \times W))$$

$$= \mu(\{ x: x \in U \& g_1^{-1} \in \Gamma_x^F \& \ldots \& g_n^{-1} \in \Gamma_x^F$$

$$\& h_1^{-1} \notin \Gamma_x^F \& \ldots \& h_m^{-1} \notin \Gamma_x^F \})$$

$$= \mu(\{ x: x \in U \& x \in A_{g_1,F} \& \ldots \& x \in A_{g_n,F}$$

$$\& x \notin A_{h_1,F} \& \ldots \& x \notin A_{h_m,F} \})$$

$$= \mu(U \cap A_{g_1,F} \cap \cdots \cap A_{g_n,F}$$

$$\cap (X \setminus A_{h_1,F}) \cap \cdots \cap (X \setminus A_{h_m,F}).$$

This function is continuous in the (strong) topology of $S(E)$, so $\Phi$ is continuous.

(b) $\Phi$ is 1-1: For Borel $B \subseteq X, g \in \Gamma$, let $N_{g,B} = B \times \{ a \in P_1(\Gamma): g^{-1} \in a \}$. Then $\mu_F(N_{g,B}) = \mu(B \cap A_{g,F})$. Thus $\Phi(F) = \Phi(F')$ implies that $\mu(F \cap A_{g,F}) = \mu(F' \cap A_{g,F})$, for any $B, g$, so $A_{g,F} = A_{g,F'}$ and $F = F'$.

(c) $\Phi^{-1}$ is continuous: We check that

$$\mu_{F_n} \Rightarrow \mu_F \Rightarrow F_n \Rightarrow F.$$

Let $\mathcal{D}$ be the collection of clopen sets in $X$, so that $\mathcal{D} \subseteq \text{MALG}$ is countable dense in MALG. Then for $D \in \mathcal{D}$, $N_{g,D}$ is clopen in $X \times P_1(\Gamma)$, so $\mu_{F_n}(N_{g,D}) \to \mu_F(N_{g,D})$. Thus $\mu(D \cap A_{g,F_n}) \to \mu(D \cap A_{g,F})$ for all $D \in \mathcal{D}, g \in \Gamma$, therefore, by Proposition 3.13, $A_{g,F_n} \text{MALG} \to A_{g,F}$ for all $g \in \Gamma$, and so $F_n \to F$. \qed
Thus the topological space $S(E)$ can be identified with a $G_\delta$ subspace of $\mathcal{M}$ and this gives another description of the topology of $S(E)$.

(3) The final description is due to Peter Burton.

Let $\Gamma$ be a countable group and let $A(\Gamma, X, \mu)$ be the space of measure preserving actions of $\Gamma$ on $(X, \mu)$. Denote by $(A(\Gamma, X, \mu), u)$ the space of measure preserving actions of $\Gamma$ on $(X, \mu)$ with the uniform topology $u$ (see [K, Section 10, (A)]). Here we consider the product topology on $\text{Aut}(\Gamma, X, \mu)$, where $\text{Aut}(\Gamma, X, \mu)$ is given the uniform topology. The space $A(\Gamma, X, \mu)$ is then viewed as a closed subspace of $\text{Aut}(\Gamma, X, \mu)$ in this product topology.

Consider now the case $\Gamma = F_\infty$, the free group with a countably infinite sequence of free generators $(\gamma_i)$. Then a complete compatible metric for $(A(\Gamma, E), u)$ is given by
\[
\delta(a_1, a_2) = \sum_{i=0}^{\infty} 2^{-(i+1)} d_u(\gamma_i^{a_1}, \gamma_i^{a_2}).
\]

Fix a generating sequence of involutions $(T_i)$ for $E$. Then the following is a compatible metric for the topology of $S(E)$
\[
\rho(F_1, F_2) = \sum_{i=0}^{\infty} 2^{-(i+1)} \mu(A_{T_i} F_1 \Delta A_{T_i} F_2)
\]
(see Section 3, (B)).

Note that the metric $\rho$ is complete. Indeed if $(F_n)$ is a $\delta$-Cauchy sequence, then for each $i$, $(A_{T_i} F_n)$ is a Cauchy sequence in the usual metric of MALG given by $\mu(A \Delta B)$. The argument in the proof of Proposition 3.10 shows then that for each $T \in [E]$ the sequence $(A_{T_i} F_n)$ is Cauchy in the metric of MALG and thus converges to some $A_T$. Then the argument in the proof of Theorem 3.12 shows that there is an $F \in S(E)$ such that $F_n \to F$.

We define a map $\Psi: S(E) \to A(F_\infty, E)$ as follows: We let $\Psi(F) = a$, where the action $a$ is defined by letting $\gamma_i^a(x) = T_i(x)$, if $T_i(x) F x$, and $\gamma_i^a(x) = x$, otherwise. Denoting by $E_a$ the equivalence relation generated by an action $a$, we have that $F = E_{\Psi(F)}$. 

24
Theorem 3.27. $\Psi$ is an isometric embedding of $(S(E), \rho)$ onto a closed subspace of $(A(\mathbb{F}_\infty, E), \delta)$.

Proof. To show that $\Psi$ is an isometry it is enough to check that for each $i$, and each $F_1, F_2$ in $S(E)$ with $\Psi(F_1) = a_1, \Psi(F_2) = a_2$, we have
$$\{x : \gamma_{a_1}^i(x) \neq \gamma_{a_2}^i(x)\} = A_{T_i,F_1} \Delta A_{T_i,F_2},$$
which follows easily from the definitions. Finally the range of $\Psi$ is closed, since the metric $\delta$ is complete.

Therefore the topological space $S(E)$ can be identified with a closed subspace of $(A(\mathbb{F}_\infty, E), u)$.

(E) Continuity of operations. We discuss here the continuity (or lack thereof) of various operations in $S(E)$.

The operation $(F_1, F_2) \mapsto F_1 \cap F_2$ from $S(E) \times S(E)$ to $S(E)$ is continuous. The relations $F_1 \subseteq F_2$ and $F_1 \perp F_2$ (see [KM], Section 27) are closed in $S(E) \times S(E)$. Moreover the map $(F_1, F_2) \mapsto F_1 \times F_2$ from $S(E_1) \times S(E_2)$ to $S(E_1 \times E_2)$ is continuous. Finally the map
$$(F, A) \in S(E) \times MALG \to F|A \in S(E),$$
where $F|A = \{(x, y) : (x, y \in A \& xEy) \vee x = y\}$, is continuous.

One the other hand, the operation $(F_1, F_2) \mapsto F_1 \lor F_2$ from $S(E) \times S(E)$ to $S(E)$ is not continuous, if $E$ is aperiodic. (Here $F_1 \lor F_2$ is the smallest equivalence relation containing both $F_1, F_2$.) To see this let $S \in [E]$ be aperiodic and let $F_n = E_{S^n}$, so that the $F_n$ are decreasing and $\bigcap_n F_n = id$, thus $F_n \to id$. Let also $F = F_{S^3}$. Since for each $n, 2^n$ and $3$ are relatively prime, it is clear that $F_n \lor F = E_{S^n}$. On the other hand $id \lor F = E_{S^3} \neq E_S$.

Proposition 3.28. The operation $(F_1, F_2) \mapsto F_1 \lor F_2$ from $S(E) \times S(E)$ to $S(E)$ is of Baire class 1.

Proof. For each $T_1, T_2 \in [E]$ and $F \in S(E)$, let
$$A_{T_1,T_2,F} = \{x : (T_1(x), T_2(x)) \in F\}$$
(so that $A_{T,F} = A_{id,T,F}$). Since $A_{T_1,T_2,F} = T_1^{-1}(A_{T_2T_1^{-1},F})$, it is clear that $F \mapsto A_{T_1,T_2,F}$ is continuous for every $T_1, T_2 \in [E]$.

25
In order to prove the proposition, it is enough to show that for any \( T \in [E], \alpha < \beta \) in \( \mathbb{R} \),
\[
\{(F_1, F_2): \alpha < \mu(A_{T,F_1 \lor F_2}) < \beta\}
\]
is \( F_\sigma \). Let \((T_i)_{i \in \mathbb{N}}\) be a generating sequence for \( E \).

Let \( x \in A^n_{T,F_1,F_2} \iff \exists m \leq n \exists i_1, \ldots, i_{2m+1} \leq n(x \in A_{T_{i_1},F_1} \& x \in A_{T_{i_1},T_{i_2},F_2} \& \ldots \& x \in A_{T_{i_{2m}},T_{i_{2m+1}},F_1} \& x \in A_{T_{i_{2m+1}},T,F_2}). \)

Then \( A^n_{T,F_1,F_2} \subseteq A^{n+1}_{T,F_1,F_2} \) and \( A_{T,F_1 \lor F_2} = \bigcup_n A^n_{T,F_1,F_2}. \) So
\[
\mu(A_{T,F_1 \lor F_2}) > \gamma \iff \exists n(\mu(A^n_{T,F_1,F_2}) > \gamma).
\]

Since \( A^n_{T,F_1,F_2} \) is equal to
\[
\bigcup_{m \leq n} \bigcup_{i_1, \ldots, i_{2m+1} \leq n} (A_{T_{i_1},F_1} \cap A_{T_{i_1},T_{i_2},F_2} \cap \cdots \cap A_{T_{i_{2m}},T_{i_{2m+1}},F_1} \cap A_{T_{i_{2m+1}},T,F_2}),
\]
the map \((F_1, F_2) \mapsto A^n_{T,F_1,F_2}\) is continuous and thus the set \( \{(F_1, F_2): \gamma < \mu(A_{T,F_1 \lor F_2})\} \) is open, for every \( \gamma \in \mathbb{R} \). It follows that \( \{(F_1, F_2): \mu(A_{T,F_1 \lor F_2}) < \beta\} = S(E)^2 \setminus \{(F_1, F_2): \forall n(\beta - \frac{1}{n} < \mu(A_{T,F_1 \lor F_2}))\} \) is \( F_\sigma \) and so \( \{(F_1, F_2): \alpha < \mu(A_{T,F_1 \lor F_2}) < \beta\} \) is \( F_\sigma. \)

\( \square \)

\( (F) \) The uniform topology. We will next discuss a stronger topology for \( S(E) \). Recall that the topology on \( S(E) \) is the smallest topology making the functions \( F \mapsto A_{T,F}, T \in [E], \) from \( S(E) \) to \( \text{MALG}, \) continuous. It is also the smallest topology making the functions \( F \mapsto \mu(A_{T,F}), T \in [E], \) from \( S(E) \) to \([0, 1], \) continuous. This topology is induced by the equivalent metrics:
\[
\tau(F_1, F_2) = \sum_{i=0}^{\infty} 2^{-(i+1)} \mu(A_{T_i,F_1} \Delta A_{T_i,F_2}),
\]
\[
\tau'(F_1, F_2) = \sum_{i=0}^{\infty} 2^{-(i+1)} |\mu(A_{T_i,F_1}) - \mu(A_{T_i,F_2})|,
\]

26
where \((T_i)_{i \in \mathbb{N}}\) is a dense sequence in \([E]\). Consider now the following two metrics:

\[
\tau_\infty(F_1, F_2) = \sup_i \mu(A_{T_i,F_1} \Delta A_{T_i,F_2}) = \sup_{T \in [E]} \mu(A_{T,F_1} \Delta A_{T,F_2}),
\]

\[
\tau'_\infty(F_1, F_2) = \sup_i |\mu(A_{T_i,F_1}) - \mu(A_{T_i,F_2})| = \sup_{T \in [E]} |\mu(A_{T,F_1}) - \mu(A_{T,F_2})|.
\]

**Proposition 3.29.** \(\tau'_\infty \leq \tau_\infty \leq 3\tau'_\infty\).

**Proof.** Clearly \(\tau'_\infty \leq \tau_\infty\). Let now \(\tau'_\infty(F_1, F_2) = a\). We will show that \(\tau_\infty(F_1, F_2) \leq 3a\). We have that \(|\mu(A_{T,F_1}) - \mu(A_{T,F_2})| \leq a\), for all \(T \in [E]\), so in particular for \(S \in [F_1]\), \(1 - \mu(A_{S,F_2}) \leq a\), i.e., \(d(S, F_2) \leq a\). Now given \(T \in [E]\), there is \(S \in [F_1]\) such that \(x \in A_{T,F_1} \implies S(x) = T(x)\) (see Proposition 3.2). Then by the last two paragraphs of the proof of Theorem 3.14,

\[\mu(A_{T,F_1} \setminus A_{T,F_2}) \leq d(S, F_2) \leq a\]

and also

\[\mu(A_{T,F_1} \setminus A_{T,F_2}) - \mu(A_{T,F_2} \setminus A_{T,F_1}) = \mu(A_{T,F_1}) - \mu(A_{T,F_2}),\]

therefore

\[\mu(A_{T,F_2} \setminus A_{T,F_1}) \leq \mu(A_{T,F_1} \setminus A_{T,F_2}) + a \leq 2a,
\]

so \(\mu(A_{T,F_1} \Delta A_{T,F_2}) \leq 3a\), thus \(\tau_\infty(F_1, F_2) \leq 3a\). \(\square\)

Thus \(\tau_\infty, \tau'_\infty\) induce the same topology which we call the **uniform topology** of \(S(E)\). It clearly contains the topology of \(S(E)\). It is easy to see that the metric \(\tau_\infty\) (or equivalently \(\tau'_\infty\)) is complete. Indeed let \((F_n)\) be \(\tau_\infty\)-Cauchy. Then it is also \(\tau\)-Cauchy (where we can assume that \(\tau\) is defined using a countable dense subgroup of \([E]\)), so, by the proof of Theorem 3.12, there is \(F \in S(E)\), such that \(F_n \to F\) (in the topology of \(S(E)\)). Fix now \(\epsilon > 0\) and let \(N\) be big enough, so that for \(m, n \geq N\), we have \(\tau'_\infty(F_m, F_n) \leq \epsilon\). Let \(T \in [E]\) and then choose \(N_0 > N\) such that for \(m \geq N_0\), \(|\mu(A_{T,F_n}) - \mu(A_{T,F_0})| \leq \epsilon\). Then for \(n \geq N\) we have

\[|\mu(A_{T,F_n}) - \mu(A_{T,F})| \leq |\mu(A_{T,F_n}) - \mu(A_{T,F_0})| + |\mu(A_{T,F_0}) - \mu(A_{T,F})| \leq 2\epsilon,
\]

thus \(\tau'_\infty(F_n, F) \leq 2\epsilon\).

However the uniform topology is not separable.

**Proposition 3.30.** Let \(E\) be aperiodic. Then the uniform topology on \(S(E)\) is not separable.
Let $T \in [E]$ be aperiodic. Then there is free Borel action $a$ of $\mathbb{Z}_2^\mathbb{N}$ such that $E_a = E_T$. For $\Gamma$ a subgroup of $\mathbb{Z}_2^\mathbb{N}$ consider the subequivalence relation $E_\Gamma$ induced by the restriction of the action $a$ to $\Gamma$. There are clearly uncountably many such $\Gamma$ and the map $\Gamma \mapsto E_\Gamma$ is injective. Suppose now that $\Gamma$ is not contained in $\Delta$ and choose $\gamma \in \Gamma \setminus \Delta$. Then $\mu(A_{\gamma^a, E_\Gamma}) = 1$. On the other hand, by the freeness of $a$, there is no $x$ such that $\gamma^a(x) = \delta^a(x)$, for some $\delta \in \Delta$. Thus $\mu(A_{\gamma^a, E_\Delta}) = 1$. It follows that $\tau'_\infty(E_\Gamma, E_\Delta) = 1$, thus the uncountable set consisting of the $E_\Gamma$’s is discrete. 

**Remark 3.31.** Recall the metric $\sigma$ on $S(E)$ defined in Remark 3.16. Then $\tau \leq \sigma$, thus the topology induced by $\sigma$ contains the uniform topology. In particular, the uniform topology is separable when restricted to the finite subequivalence relations of $E$. 

4 Limits of sequences

The following is a basic fact that shows how the limit of a convergent sequence in $S(E)$ is related to the members of the sequence.

**Theorem 4.1.** Let $F_n, F \in S(E)$ and $F_n \to F$. Then for each $i$, there is an increasing sequence $n_0^{(i)} < n_1^{(i)} < \ldots$, so that $(n_m^{(i)})_{m \in \mathbb{N}}$ is a subsequence of $(n_m^{(i)})_{m \in \mathbb{N}}$ and

$$F = \bigcup_{m} \bigcap_{k \geq m} F_{n_k^{(i)}}.$$

**Proof.** Let $\{T_i\}_{i \in \mathbb{N}}$ be a countable subset of $[F]$, with $T_0 = id$, such that $xFy \iff \exists i(T_i(x) = y)$. We will define for each $i$ an increasing sequence

$$n_0^{(i)} < n_1^{(i)} < \ldots,$$

so that $(n_m^{(i+1)})_{m \in \mathbb{N}}$ is a subsequence of $(n_m^{(i)})_{m \in \mathbb{N}}$ and moreover if we put

$$R_{i,m} = \bigcap_{k \geq m} F_{n_k^{(i)}},$$

then for (almost) all $x$,

$$(x, T_i(x)) \in \bigcup_{m} R_{i,m}.$$

We construct $(n_m^{(i)})$, recursively on $i$.

To start with, take $n_0^{(0)} = m$. Assume now $(n_m^{(i)})$ is defined. We will next define $(n_m^{(i+1)})$.

Consider $T_{i+1} \in [F]$. Since $d(T_{i+1}, F) = 0$,

$$d(T_{i+1}, F_n) = \mu(\{x : (x, T_{i+1}(x)) \notin F_n\}) \to 0,$$

so we can find a subsequence $(n_m^{(i+1)})$ of $(n_m^{(i)})$ with $\mu(A_m) < 2^{-(m+1)}$, where

$$A_m = \{x : (x, T_{i+1}(x)) \notin F_{n_m^{(i+1)}}\}.$$

Thus, by the Borel-Cantelli Lemma, $\mu(\overline{\lim}_{m} A_m) = 0$, where $\overline{\lim}_{m} A_m = \bigcap_{m} \bigcup_{k \geq m} A_k$. Therefore, $\mu(\overline{\lim}_{m} (\sim A_m)) = 1$, where $\overline{\lim}_{m} B_m = \bigcup_{m} \bigcap_{k \geq m} B_k$, i.e., for almost all $x$, there is $m$ such that for all $k \geq m$, $(x, T_{i+1}(x)) \notin F_{n_k^{(i+1)}}$, thus $(x, T_{i+1}(x)) \in \bigcup_m R_{i+1,m}$. 29
Now note that \( R_{i,m} \subseteq R_{i+1,m} \) and \( R_{i,m} \subseteq R_{i,m+1} \), thus \( R_{i,m} \subseteq R_{j,m} \) if \( i \leq j, m \leq n \). So let \( R_m = R_{m,m} \). Then clearly \( \bigcup_{r,m} R_{i,m} = \bigcup_{m} R_{r,m} \) and \( R_0 \subseteq R_1 \subseteq \ldots \). Finally if \( (x, y) \in F \), then for some \( i, y = T_i(x) \), so \((x, y) \in \bigcup_{m} R_{i,m} \subseteq \bigcup_{m} R_{r,m} \), i.e., \( F \subseteq \bigcup_{m} R_{r,m} \). We thus have \( F \subseteq \bigcup_{m} \bigcap_{k \geq m} F^{(m)}_{n_k} \).

We will now verify that conversely \( R = \bigcup_{m} \bigcap_{k \geq m} F^{(m)}_{n_k} \subseteq F \).

Let \( T \in [R] \) in order to show that \( T \in [F] \). We have \( \forall x \exists m[(x, T(x)) \in \bigcap_{k \geq m} F^{(m)}_{n_k}] \). Let

\[
A_m = \left\{ x : (x, T(x)) \in \bigcap_{k \geq m} F^{(m)}_{n_k} \right\},
\]

so that \( \bigcup_{m} A_m = X \). Now \( F^{(m)}_{n_k} \to F \) as \( k \to \infty \), so \( A_{T,F}^{(m)}_{n_k} \to A_{T,F} \) MALG. Since \( A_m \subseteq A_{T,F}^{(m)}_{n_k} \) for all \( k \geq m \), by taking limits as \( k \to \infty \), we obtain \( A_m \subseteq A_{T,F} \), i.e., \( x \in A_m \Rightarrow (x, T(x)) \in F \) and so \((x, T(x)) \in F \) for all \( x \), i.e., \( T \in [F] \). \( \square \)

For \( \mathcal{R} \) a class of measure preserving countable Borel equivalence relations on \((X, \mu)\), let

\[
\mathcal{R}_+ = \left\{ \bigcap_{n} F_n : F_0 \supseteq F_1 \supseteq \ldots, F_i \in \mathcal{R} \right\},
\]

and

\[
\mathcal{R}_\uparrow = \left\{ \bigcup_{n} F_n : F_0 \subseteq F_1 \subseteq \ldots, F_i \in \mathcal{R} \right\}.
\]

**Theorem 4.2.** Let \( \mathcal{R} \subseteq S(E) \) be closed under finite intersections. Then

\[
\overline{\mathcal{R}} = (\mathcal{R}_+)\uparrow.
\]

(where \( \overline{\mathcal{R}} \) is the closure of \( \mathcal{R} \) in \( S(E) \)).
Proof. Clearly \((R_i)’ \subseteq \overline{R}\). The converse follows from Theorem 4.1, noting that \(\bigcap_{k \geq m} F^{n_k}_{(m)}\) can be written as a decreasing intersection of relations in \(R\). \(\square\)

Put

\[ R^* = (R_i)^+ \]

The preceding shows that if \(R \subseteq S(E)\) is closed under finite intersections, then \(R^* = \overline{R}\) and thus \((R^*)^* = R^*.\) Also note that if \(R\) is hereditary, i.e., closed under subequivalence relations, then \(\overline{R} = R^* = R_i^\uparrow\).

This has the following implication concerning arbitrary hereditary classes of equivalence relations (not necessarily within a fixed \(S(E)\)). It was originally proved (in a somewhat stronger form not requiring invariance of the measure) in Boykin-Jackson [BJ, page 116].

**Corollary 4.3** (Boykin-Jackson [BJ]). Let \(R\) be a hereditary class of countable measure preserving equivalence relations on \((X, \mu)\). Then \(R_i^\uparrow\) is closed under taking unions of increasing sequences of relations, i.e., \((R_i^\uparrow)^\uparrow = R_i^\uparrow\).

**Proof.** Let \(S_n \in R_i^\uparrow, S_0 \subseteq S_1 \subseteq \ldots, E = \bigcup_n S_n\). Then if \(R_E = S(E) \cap R\), we have that \((R_E)^\uparrow = S(E) \cap R_i^\uparrow\) and \(S_n \in (R_E)^\uparrow\), so \(E \in \overline{R_E}\), by Proposition 3.5, and thus \(E \in R_i^\uparrow\). \(\square\)

As in the proof of Corollary 4.3, for any class \(R\) of countable measure preserving equivalence relations on \((X, \mu)\) closed under finite intersections (not necessarily contained in some \(S(E)\)), we have \((R^*)^* = R^*\).

Put also

\[ R_\uparrow = (R_i^\downarrow)’ \]

If \(R\) is closed under finite intersections, then \(R_\uparrow \subseteq \overline{R} = R^*\).

**Problem 4.4.** If \(R\) is closed under finite intersections, is it true that \(R_\uparrow = R^*\) ?

We have the following corollary of Theorem 4.1. Below \(id\) is the equality equivalence relation.

**Corollary 4.5.** If \(F_n \in S(E), F_n \rightarrow id\), then \(\bigcap_n F_n = id\).

**Proof.** By Theorem 4.1, there is an increasing sequence \((n_i)\) with \(\bigcap_i F_{n_i} = id\) and thus \(\bigcap_n F_n = id\). \(\square\)
We finally note an analog of Theorem 4.1 for the uniform topology.

**Theorem 4.6.** Let $F_n, F \in S(E)$ and $F_n \to F$ in the uniform topology. Then there is an increasing sequence $n_0 < n_1 < \ldots$, so that

$$F = \bigcup_{m} \bigcap_{k \geq m} F_{n_k}.$$

**Proof.** We have

$$\sup_{T \in [F]} \mu(X \setminus A_{T,F}) \to 0,$$

therefore let $n_0 < n_1 < \ldots$ be such that for every $T \in [F], \mu(X \setminus A_{T,F_{n_m}}) < 2^{-(m+1)}$. Then for every $T \in [F], \mu(\lim_{m}(A_{T,F_{n_m}})) = 1$, so for every $T \in [F]$ and (almost) all $x$ there is $m$ such that for all $k \geq m$, $x \in A_{T,F_{n_k}}$. It follows that

$$F \subseteq \bigcup_{m} \bigcap_{k \geq m} F_{n_k}.$$

The reverse inclusion follows as in last part of the proof of Theorem 4.1. \qed
5 The space of equivalence relations

(A) We consider now the relation of the topologies of $S(E), S(F)$, when $E \subseteq F$.

Theorem 5.1. Let $E \subseteq F$. Then $S(E)$ is a closed subset of $S(F)$ and the topology of $S(E)$ is the relative topology from $S(F)$.

Proof. From Theorem 4.1 it is clear that $S(E)$ is a closed subset of $S(F)$. Moreover it is clear that if $E_n \subseteq E$ and $E_n \rightarrow E_\infty$ in $S(F)$, then $E_n \rightarrow E_\infty$ in $S(E)$. Let $\tau$ be the relative topology of $S(E)$ and $\sigma$ the topology of $S(E)$. This shows that the identity map $id: (S(E), \tau) \rightarrow (S(E), \sigma)$ is continuous. To prove that it is a homeomorphism, we will verify that if $E_n \subseteq E$ and $E_n \rightarrow E_\infty$ in $\sigma$, then $E_n \rightarrow E_\infty$ in $\tau$. So take $T \in [F]$ in order to show that $A_{T,E_n} \rightarrow A_{T,E_\infty}$. By Proposition 3.2, there is $S \in [E]$ such that $\{ x: (x, T(x)) \in E \} = \{ x: S(x) = T(x) \}$. Let $A_n = A_{T,E_n} \subseteq \{ x: (x, T(x)) \in E_n \} \subseteq \{ x: S(x) = T(x) \}$, $B_n = \{ x: S(x) \neq T(x) \}$ and $A_n \cap B_n = \{ x: (x, S(x)) \in E_n \} = A_{S,E_n}$. Similarly define $A_\infty = A_{T,E_\infty} \subseteq \{ x: (x, T(x)) \in E_\infty \}$, $B_\infty = A_{S,E_\infty} \cap \{ x: S(x) \neq T(x) \}$, so that $A_\infty \cup B_\infty = A_{S,E_\infty}$.

Now $A_{S,E_n} \rightarrow A_{S,E_\infty}$, i.e., $A_n \cup B_n \rightarrow A_\infty \cup B_\infty$, and also $A_{S,E_n} \cap \{ x: S(x) \neq T(x) \} \rightarrow A_{S,E_\infty} \cap \{ x: S(x) \neq T(x) \}$, i.e., $B_n \rightarrow B_\infty$, therefore

$$A_n = (A_n \cup B_n) \setminus B_n \rightarrow (A_\infty \cup B_\infty) \setminus B_\infty = A_\infty,$$

or $A_{T,E_n} \rightarrow A_{T,E_\infty}$ and we are done. \qed

Denote by $\mathcal{E}$ the set of all Borel countable, measure preserving equivalence relations on $(X, \mu)$ (where again we identify two equivalence relations if they agree a.e.). Thus $\mathcal{E} = \bigcup_{E \in \mathcal{E}} S(E)$. By the preceding Theorem 5.1, the topologies on $S(E), S(F)$ agree on $S(E) \cap S(F) = S(E \cap F)$ and $S(E \cap F)$ is closed on $S(E)$ and $S(F)$. So we can define the weak topology on $\mathcal{E}$ induced by the spaces $S(E)$, which is the topology on $\mathcal{E}$ defined by declaring that $U \subseteq \mathcal{E}$ is open if $U \cap S(E)$ is open in $S(E)$ for all $E \in \mathcal{E}$. In particular $f: \mathcal{E} \rightarrow Y$, $Y$ a topological space, is continuous if $f|S(E): S(E) \rightarrow Y$ is continuous for all $E \in \mathcal{E}$. Also on each $S(E)$ the relative topology from $\mathcal{E}$ coincides with its topology and $S(E)$ is closed in $\mathcal{E}$. (For the general concept
of weak topology on a set induced by topologies on families of subsets, see, e.g., [D, VI.8].

We should also note here that for $E \subseteq F$, $S(E)$ is a retract of $S(F)$, with the retraction given by the map $R \in S(F) \mapsto R \cap E \in S(E)$. Finally we point out that each space $S(E)$ is contractible (to the equality relation) by the map $\varphi: S(E) \times [0, 1] \to S(E)$ given by $\varphi(F, t) = F[1, 1-t] \cup \{(x, x) : x \in (1-t, 1]\}$, where without loss of generality we assume that $X = [0, 1]$ and $\mu$ is Lebesgue measure.

**(B)** We will next give another description of the weak topology of $\mathcal{E}$. Consider the compact space $[0, 1]^{\text{Aut}(X, \mu)}$ with the product topology. Define

$$\Pi: \mathcal{E} \to [0, 1]^{\text{Aut}(X, \mu)}$$

by $\Pi(F)(T) = d(T, F)$. Since $[F] = \{T : d(T, F) = 0\}$, clearly $\Pi$ is injective.

**Proposition 5.2.** The map $\Pi$ is a homeomorphism of $\mathcal{E}$ with a subspace of $[0, 1]^{\text{Aut}(X, \mu)}$.

**Proof.** Below denote by $\tau$ the weak topology of $\mathcal{E}$. We first verify that $\Pi$ is continuous. Let $V = \bigcap_{i=1}^{n} V_i$ be a basic open set in $[0, 1]^{\text{Aut}(X, \mu)}$, where $V_i = \{ p \in [0, 1]^{\text{Aut}(X, \mu)} : p(T_i) \in U_i \}$, with $U_i$ open in $[0, 1]$. Then

$$\Pi^{-1}(V) = \{ F \in \mathcal{E} : d(T_i, F) \in U_i, 1 \leq i \leq n \}.$$

Let $F \in \mathcal{E}$ be such that $T_i \in [F]$ for all $1 \leq i \leq n$. Then $\Pi^{-1}(V) \cap S(F)$ is open in $S(F)$. Since for each $E \in \mathcal{E}$ there is such an $F$ containing $E$, it follows from Theorem 5.1 that $\Pi^{-1}(V) \cap S(E)$ is open in $S(E)$ for each $E \in \mathcal{E}$, so $\Pi^{-1}(V)$ is $\tau$-open.

Conversely, we show that $\Pi$ sends $\tau$-closed sets to closed subsets of $\Pi(\mathcal{E})$ (in its relative topology from $[0, 1]^{\text{Aut}(X, \mu)}$), so $\Pi^{-1}$ is also continuous.

Fix $\mathcal{F} \subseteq \mathcal{E}$ which is $\tau$-closed. Let $(F_i)_{i \in I}$ be a net in $\mathcal{F}$ and $F \in \mathcal{E}$ be such that $\Pi(F_i) \to \Pi(F)$, i.e., $d(T, F_i) \to d(T, F), \forall T \in \text{Aut}(X, \mu)$. We will show that $F \in \mathcal{F}$.

We inductively define an increasing sequence $E_0 \subseteq E_1 \subseteq \ldots$ of elements of $\mathcal{E}$ and for each $n \in \mathbb{N}$ a countable dense subset $\{T^n_k\}_{k \in \mathbb{N}}$ of $[E_n]$ such that $\{T^n_k\}_{k \in \mathbb{N}} \subseteq \{T^{n+1}_k\}_{k \in \mathbb{N}}$, as follows:

(i) $E_0 = F$, $\{T^n_k\}_{k \in \mathbb{N}}$ is some dense subset of $[E_0]$.

(ii) Given $E_n$, $\{T^n_k\}_{k \in \mathbb{N}}$, for each $l \geq 1$, finite sequence $\overline{m} = (m_1, \ldots, m_l) \in \mathbb{N}^l$, and $\epsilon \in \mathbb{Q}^+$, find $F^m_{\overline{m}, \epsilon} \in \mathcal{F}$ such that

$$|d(T^m_{\overline{m}, F} - d(T^m_{\overline{m}, F^m_{\overline{m}, \epsilon}})| < \epsilon, 1 \leq i \leq l.$$
Put

$$E_{n+1} = E_n \lor (\bigvee_{m,\epsilon} F^n_{m,\epsilon}),$$

where for a sequence of equivalence relations \((F_j)\), \(\bigvee_j F_j\) is the smallest equivalence relation containing all \(F_j\). Finally let \(\{T^{n+1}_k\}_{k \in \mathbb{N}}\) be a dense subset of \([E_{n+1}]\) containing \(\{T^n_k\}_{k \in \mathbb{N}}\).

Let \(E = \bigcup_n E_n\). Since \(\mathcal{F} \cap S(E)\) is closed in \(S(E)\), it is enough to show that \(F\) is in the closure of \(\mathcal{F} \cap S(E)\) in \(S(E)\). Since \(\{T^n_k\}_{n,k}\) is dense in \([E]\), a basic open nbhd of \(F\) in \(S(E)\) is of the form

$$U = \bigcap_{i=1}^l \{F' \in S(E) : |d(S_i, F') - d(S_i, F)| < \epsilon\},$$

for some \(S_1, \ldots, S_l \in \{T^n_k\}_{n,k}\) and \(\epsilon \in \mathbb{Q}^+\). Then for large enough \(n\), we have that \(S_1, \ldots, S_l \in \{T^n_k\}_k\), say \(S_i = T^n_{m_i}, 1 \leq i \leq l\). Put \(\overline{m} = (m_1, \ldots, m_l)\). Then by construction \(F^n_{\overline{m},\epsilon} \in \mathcal{F} \cap U\) and the proof is complete.

Thus \(\mathcal{E}\) can be viewed as a subspace of \([0,1]^{\text{Aut}(X, \mu)}\), so, in particular, it is Hausdorff. On the other hand it is neither separable or first countable.

**Proposition 5.3.** The weak topology on \(\mathcal{E}\) is not separable.

**Proof.** The closure of any countable set \(\{F_n\} \subseteq \mathcal{E}\) is clearly contained in \(S(\bigvee_n F_n)\). \(\square\)

**Proposition 5.4.** The weak topology of \(\mathcal{E}\) is not first countable.

**Proof.** We will use the following lemma. Below for \(T \in \text{Aut}(X, \mu)\), \(E_T\) is the equivalence relation generated by \(T\).

**Lemma 5.5.** Let \(F \in \mathcal{E}, S_1, S_2, \ldots \in \text{Aut}(X, \mu)\) and \(T \in \text{Aut}(X, \mu)\) be such that \(E_T \perp (F \lor (\bigvee_{i=1}^\infty E_{S_i}))\). Then for every \(i \geq 1\), \(d(S_i, F \lor E_T) = d(S_i, F)\).

**Proof.** By definition of \(\perp\), \(A_{S_i, F \lor E_T} = A_{S_i, F}\). \(\square\)

Assume now, towards a contradiction, that \(\mathcal{E}\) is first countable. Fix \(F \in \mathcal{E}\) and let \(\{U_n\}\) be a local basis at \(F\). Then, for each \(n\), there is a sequence \(T^n_1, \ldots, T^n_{k_n} \in \text{Aut}(X, \mu)\) and open sets \(V^n_1, \ldots, V^n_{k_n}\) in \([0,1]\) such that

$$F \in \bigcap_{i=1}^{k_n} \{F' : d(T^n_i, F') \in V^n_i\} \subseteq U_n.$$
Let \( R = F \lor i \leq k_n, n \in \mathbb{N} E_T^n \). The set \( \{ T \in \text{Aut}(X,\mu) : E_T \perp R \} \) is comeager in the weak topology of \( \text{Aut}(X,\mu) \) (see Conley-Miller [CM]), so fix aperiodic \( T \in \text{Aut}(X,\mu) \) with \( E_T \perp R \). Then \( d(T,F) = 1 \). Put

\[
U = \{ F' \in \mathcal{E} : d(T,F') > \epsilon \},
\]

where \( 0 < \epsilon < 1 \). Then \( F \in U \), so for some \( n, F \in U_n \subseteq U \) and thus \( F \in \bigcap_{i=1}^{k_n} \{ F' : d(T^n_i,F') \in V^n_i \} \subseteq U \). Put \( F' = F \lor E_T \). Then, since \( E_T \perp R \), we have by Lemma 5.5 that \( d(T^n_i,F') = d(T^n_i,F) \), therefore \( d(T^n_i,F') \in V^n_i \) for \( 1 \leq i \leq k_n \). Thus \( F' \in U_n \subseteq U \), so \( d(T,F') > \epsilon \). But \( T \in \{ F' \} \), so \( d(T,F') = 0 \), a contradiction. \( \Box \)

(C) To see another aspect of the global structure of \( \mathcal{E} \), consider the Polish space \( A(F_\infty,X,\mu) \) with the weak topology. The map \( a \mapsto E_a \) is a surjection from \( A(F_\infty,X,\mu) \) to \( \mathcal{E} \) and provides a canonical parametrization of \( \mathcal{E} \). Let

\[
a \sim_{F_\infty} b \iff E_a = E_b
\]

be the associated equivalence relation, so that \( \mathcal{E} = A(F_\infty,X,\mu)/\sim_{F_\infty} \).

**Proposition 5.6.** \( \sim_{F_\infty} \) is \( F_\sigma \delta \).

**Proof.** We use below letters \( \beta,\gamma,\delta \) for elements of \( F_\infty \) and \( a,b \) for elements of \( A(F_\infty,X,\mu) \). We will verify that the negation of \( \sim_{F_\infty} \) is \( G_\delta \sigma \). For this it is enough to check that for each \( \gamma,\epsilon > 0 \) the relation

\[
P(a,b) \iff \mu(\{ x : \forall \delta (\gamma^a(x) \neq \delta^b(x)) \}) \geq \epsilon
\]

is \( G_\delta \) and for this it suffices to check that for each fixed \( \delta_1,\ldots,\delta_n \) the relation

\[
Q(a,b) \iff \mu(\{ x : \forall 1 \leq i \leq n (\gamma^a(x) \neq \delta_i^b(x)) \}) \geq \epsilon
\]

is \( G_\delta \). Since the maps \( a \mapsto \beta^a \) from \( A(F_\infty,X,\mu) \) to \( \text{Aut}(X,\mu) \) (with the weak topologies) are continuous, this reduces to showing that the relation \( R \subseteq \text{Aut}(X,\mu)^{n+1} \) given by

\[
R(T,S_1,\ldots,S_n) \iff \mu(\bigcap_{i=1}^n \text{supp}(T^{-1}S_i)) \geq \epsilon
\]

is \( G_\delta \), where as usual
supp(T) = \{x: T(x) \neq x\}.

This is clear, since the map

\( (U_1, \ldots, U_n) \in \text{Aut}(X, \mu) \mapsto (\text{supp}(U_1), \ldots, \text{supp}(U_n)) \in \text{MALG}^n \)

is of Baire class 1 (see [K, page 4]).

Below let \( E_{\text{ctble}} \) be the equivalence relation on \( P^\mathbb{N} \), where \( P \) is an uncountable Polish space, given by

\( (x_n) E_{\text{ctble}} (y_n) \iff \{x_n: n \in \mathbb{N}\} = \{y_n: n \in \mathbb{N}\} \).

It is well known that this is a non-smooth equivalence relation and moreover it is \( F_{\sigma\delta} \)-complete (as a set of pairs). Below for Borel equivalence relations \( E, F \) in Polish spaces \( X, Y \), we let \( E \leq_c F \) mean that there is a continuous reduction from \( E \) to \( F \).

**Theorem 5.7.** \( E_{\text{ctble}} \leq_c \sim_{F\infty} \), so, in particular, \( \sim_{F\infty} \) is \( F_{\sigma\delta} \)-complete (as a set of pairs) and non-smooth.

**Proof.** Let \( R_n \subseteq \text{Aut}(X, \mu)^n \) be defined by

\( R_n(T_1, \ldots, T_n) \iff \forall 1 \leq i \leq n(E_{T_1} \perp E_{T_1, \ldots, T_{i-1}, T_{i+1}, \ldots, T_n}) \).

By Conley-Miller [CM] and the Kuratowski-Ulam Theorem, a simple induction on \( n \) shows that each \( R_n \) is comeager in \( \text{Aut}(X, \mu)^n \). Thus by the Kuratowski-Mycielski Theorem (see [K2, 19.1]), there is a Cantor set \( P \subseteq \text{Aut}(X, \mu) \) so that for any distinct \( T_1, \ldots, T_n \in P \) we have \( R_n(T_1, \ldots, T_n) \).

Define now \( f: P^\mathbb{N} \to A(\mathbb{F}_\infty, X, \mu) \) by \( f((T_i)) = a \), where \( \gamma_i^a = T_i \), with \( (\gamma_i) \) free generators of \( \mathbb{F}_\infty \). Clearly \( f \) is continuous and a reduction of \( E_{\text{ctble}} \) to \( \sim_{F\infty} \).

It can be also shown that \( \sim_{F\infty} \) is Borel reducible to an equivalence relation induced by a Borel action of a Polish group. In fact, by using a slightly different parametrization of \( \mathcal{E} \), the associated equivalence relation is again \( F_{\sigma\delta} \) and induced by a continuous action of a Polish group (see Törnquist [T, page 33]).

The preceding show that it is not possible to find a “definable” injection of \( \mathcal{E} \) into a standard Borel space, so in particular \( \mathcal{E} \) does not admit any “definable” separable metrizable topology. The following remain open:
Problem 5.8. What is the complexity of the equivalence relation (as a set of pairs) on the space \( A(\Gamma, X, \mu) \) (in the weak topology) given by

\[ a \sim \Gamma b \iff E_a = E_b, \]

for other groups \( \Gamma \), e.g., \( \Gamma = \mathbb{Z} \)?

Problem 5.9. Determine the complexity of the equivalence relation \( \sim_{\mathbb{F}_\infty} \) in the hierarchy of Borel equivalence relations.

(D) We finally note an interesting property of the poset \((E, \subseteq)\). We start with the following simple observation.

Let \((P, \leq)\) be an upper semilattice having the following two properties:
(i) there is no strictly increasing \(\omega_1\) sequence in \(P\) and (ii) every increasing \(\omega\) sequence in \(P\) has a least upper bound. Then for every function \(f : P \to P\) and every \(p \in P\), there is \(q \geq p\) such that \(f(q) \leq q\). Indeed if this fails, then for some \(p_0\) and all \(q \geq p_0\) we have that \(q^* = q \lor f(q) > q\), which using (ii) above produces a strictly increasing \(\omega_1\) sequence. Moreover note that if \(f\) is \(\omega\)-continuous, i.e., for any increasing sequence \((p_n)\) we have that \(f(\operatorname{lub} p_n) = \operatorname{lub} f(p_n)\), then the set \(\{p \in P : f(p) \leq p\}\) is \(\omega\)-closed, i.e., closed under suprema of increasing sequences, and cofinal.

In the following discussion, we work in \(\text{ZF} + \text{DC} + \text{AD}\).

By a result of Harrington [H] there is no injective \(\omega_1\) sequence of \(F_{\sigma\delta}\) sets and thus condition (i) above holds for \((E, \subseteq)\). Clearly condition (ii) is also true. Thus for every \(f : E \to E\) and every \(E \in E\), there is \(F \supseteq E\), with \(f(F) \subseteq F\). An interesting example of such an \(f\) is defined as follows. Fix a measure preserving bijection \(\phi\) of \(X^2\) (with the product measure) with \(X\) and let \(f(E)\) be the image of \(E \times E\) by \(\phi\). Clearly \(f\) is \(\omega\)-continuous. It follows that there is an \(\omega\)-closed, cofinal set of \(E\) for which \(E \times E\) is isomorphic to a subequivalence relation of \(E\).

We work next in the stronger theory \(\text{ZF} + \text{DC} + \text{AD}_\mathbb{R}\).

Let for any uncountable Polish space \(Z\), \(\mathcal{P}_{\aleph_1}(Z)\) be the set of all countable subsets of \(Z\). Solovay [S] has shown that \(\mathcal{P}_{\aleph_1}(Z)\) admits a non-principal, countably complete ultrafilter \(U\) defined by:

\[ A \in U \iff A \text{ contains an } \omega\text{-closed, cofinal subset.} \]

(Here a subset \(C \subseteq \mathcal{P}_{\aleph_1}(Z)\) is called \(\omega\)-closed if for any \(S_0 \subseteq S_1 \subseteq \ldots\), with \(S_n \in C, \forall n\), we have that \(\bigcup_n S_n \in C\). It is cofinal if for any \(S \in \mathcal{P}_{\aleph_1}(Z)\) there is \(T \in C\) with \(S \subseteq T\).)
We can use this to define a non-principal, countably complete ultrafilter on \( \mathcal{E} \) as follows: For each \( S \in \mathcal{P}_{\omega_1}(\text{Aut}(X, \mu)) \), let \( E_S \) be the equivalence relation generated by \( S \). Then for every \( \mathcal{R} \subseteq \mathcal{E} \), put

\[
\mathcal{R} \in \mathcal{U}_E \iff \{ S : E_S \in \mathcal{R} \} \in \mathcal{U}.
\]

It is easy to see that if \( \mathcal{R} \subseteq \mathcal{E} \) is \( \omega \)-closed and cofinal in \( (\mathcal{E}, \subseteq) \), then \( \mathcal{R} \in \mathcal{U}_E \), thus \( \mathcal{U}_E \) contains the countably complete filter of sets containing an \( \omega \)-closed, cofinal subset of \( \mathcal{E} \). The following is open:

**Problem 5.10.** Is the filter generated by the \( \omega \)-closed, cofinal subsets of \( \mathcal{E} \) an ultrafilter? Equivalently, is \( \mathcal{U}_E \) equal to that filter?

In any case, the ultrafilter \( \mathcal{U}_E \) provides a natural way to define a notion of “largeness” for sets of equivalence relations. For example, the class of ergodic equivalence relations is “large”, i.e., belongs to \( \mathcal{U}_E \) (and we will see in Section 10 that so is the class of richly ergodic ones, being \( \omega \)-closed, cofinal). On the other hand, the class of hyperfinite equivalence relations is “small”, i.e., is not in \( \mathcal{U}_E \).

**Remark 5.11.** The above can be also viewed as results concerning “definable” functions and sets in \( \mathcal{E} \), where we interpret “definable” as meaning “belonging to some inner model of \( \text{ZF} + \text{DC} + \text{AD} \) or \( \text{ZF} + \text{DC} + \text{AD}_R \) containing the set of reals \( \mathbb{R} \)” and working in a strong enough large cardinal extension of \( \text{ZFC} \).

(\text{E}) We conclude this section by pointing out the following unboundedness property of \( \mathcal{E} \): There is no \( E \in \mathcal{E} \) such that for any \( F \in \mathcal{E} \) there is a subequivalence relation \( F' \) of \( E \) which is isomorphic to \( F \). This follows from a result of Ozawa, see [K, page 29].
6 Relations with the space of actions

Let \( \Gamma \) be a countable group and let \( (A(\Gamma, X, \mu), u) \) be the space of measure preserving actions of \( \Gamma \) on \( (X, \mu) \) with the uniform topology \( u \) and its closed subspace \( A(\Gamma, E) \). For each \( a \in A(\Gamma, E) \), let \( E_a \in S(E) \) be the equivalence relation induced by \( a \). We also let \( E_{T_1, T_2, \ldots} \) be the equivalence relation induced by \( T_1, T_2, \ldots \in \text{Aut}(X, \mu) \).

Note that if \( \Gamma = F_\infty \) the map \( a \mapsto E_a \) gives a parametrization of \( S(E) \) by \( A(F_\infty, E) \), i.e., a surjective map from \( A(F_\infty, E) \) onto \( S(E) \). By Theorem 3.27, and the paragraph preceding it, we have the following selection result.

**Theorem 6.1.** There is a continuous map \( \Psi: S(E) \to A(F_\infty, E) \) such that for \( F \in S(E) \), \( E_{\Psi(F)} = F \).

We now have:

**Theorem 6.2.** The map \( a \in A(\Gamma, E) \mapsto E_a \in S(E) \) is of Baire class 1.

**Proof.** A subbasis for the (weak) topology of \( S(E) \) consists of the sets of the form

\[
\{ F \in S(E) : d(T, F) \in (a, b) \},
\]

where \( T \in D \), with \( D \) a countable dense subset of \( [E] \), and \( a < b \) rationals. It is thus enough to show that

\[
\{ a \in A(\Gamma, E) : d(T, E_a) \in (a, b) \}
\]

is \( F_\sigma \) and for that it suffices to show that for any such \( T \) and \( r > 0 \)

\[
\{ a \in A(\Gamma, E) : d(T, E_a) \geq r \}
\]

is closed.

So assume \( a_n \to a \) in \( A(\Gamma, E) \) and \( d(T, E_{a_n}) \geq r \). Let \( U \in E_a \) be such that \( d(T, U) = d(T, E_a) \). Then \( d(T, E_{a_n}) \leq d(T, U) + d(U, E_{a_n}) \).

**Claim.** \( d(U, E_{a_n}) \to 0 \).

Granting this \( r \leq \lim d(T, E_{a_n}) \leq d(T, U) = d(T, E_a) \).

**Proof of claim.** Fix \( \epsilon > 0 \). Find next a Borel partition \( \{A_n\}_{n=1}^\infty \) of \( X \) and elements \( \{\gamma_a\}_{n=1}^\infty \) of \( \Gamma \) with \( U = \bigcup_{\gamma_a} A_n \). Let \( N \) be large enough so
that $\sum_{n > N} \mu(A_n) < \epsilon$. Then let $M$ be large enough, so that $d(\gamma^a_i, \gamma^a_n) < \frac{\epsilon}{N}$, if $i \leq N$ and $n > M$ (here $d$ is the uniform distance). Let for $i \leq N, n > M$

$$B^a_i = \{x \in A_i : \gamma^a_i(x) = \gamma^a_n(x)\}.$$ 

Then $B^a_i \subseteq A_i$ and $\mu(A_i \setminus B^a_i) < \frac{\epsilon}{N}$, so if

$$B = \bigcup_{i > N} A_i \cup \bigcup_{i \leq N} (A^a_i \setminus B^a_i),$$

then $\mu(B) < 2\epsilon$. If $x \notin B$, then $U(x) = \gamma^a_n(x)$ for some $i \leq N$, so $(x, U(x)) \in E_{a_n}$. Thus $\{x : (x, U(x)) \notin E_{a_n}\} \subseteq B$, so

$$d(U, E_{a_n}) = \mu(\{x : (x, U(x)) \notin E_{a_n}\}) < 2\epsilon$$

for all $n > M$ and we are done. 

**Corollary 6.3.** Let $\Gamma = \mathbb{F}_\infty$. Let $\mathcal{P}$ be a property of equivalence relations such that

$$\mathcal{P}^* = \{a \in A(\Gamma, E) : E_a \in \mathcal{P}\}$$

is Borel in $A(\Gamma, E)$. Then $\mathcal{P}_E = \mathcal{P} \cap S(E)$ is Borel in the weak topology of $S(E)$. 

**Proof.** For $F \in S(E),

$$F \in \mathcal{P} \iff \exists a \in A(\Gamma, E) (E_a = F \& a \in \mathcal{P}^*)$$

$$\iff \forall a \in A(\Gamma, E) (E_a = F \Rightarrow a \in \mathcal{P}^*).$$

Since $a \mapsto E_a$ is Borel this shows that $\mathcal{P} \cap S(E)$ is both analytic and co-analytic, thus Borel. 

In particular, taking again $\Gamma = \mathbb{F}_\infty$, suppose $\mathcal{P}$ is a property of equivalence relations such that $\{a \in A(\Gamma, X, \mu) : E_a \in \mathcal{P}\}$ is Borel in the weak topology of $A(\Gamma, X, \mu)$. Since this is contained in the uniform topology of $A(\Gamma, X, \mu)$, this set is Borel in the uniform topology of $A(\Gamma, X, \mu)$ and thus $\{a \in A(\Gamma, E) : E_a \in \mathcal{P}\}$ is Borel in (the uniform topology of) $A(\Gamma, E)$. Therefore $\mathcal{P}_E$ is Borel in $S(E)$. 

**Problem 6.4.** For which countable $\Gamma$ is the map $a \in A(\Gamma, E) \mapsto E_a \in S(E)$ continuous, for each $E$?
Anush Tserunyan and Robin Tucker-Drob found the first examples that showed that this map is not always continuous.

1. (R. Tucker-Drob) Take $\Gamma = \mathbb{F}_\infty$ with free generating set $\{\gamma_m\}_{m \in \mathbb{N}}$. Fix any two transformations $S, T \in \text{Aut}(X, \mu)$ such that $E_S \vee E_T \neq E_T$. Let $E = E_S \vee E_T$ and define $a_n \in A(\Gamma, E)$ by

$$\gamma_m^{a_n} = \begin{cases} S & \text{if } m > n, \\ T & \text{if } m \leq n. \end{cases}$$

Also define $a \in A(\Gamma, E)$ by $\gamma_m^a = T$ for all $m$. Clearly $E_{a_n} = E$ and $E_a = E_T$. Also $a_n$ converges uniformly to $a$. On the other hand, the constant sequence $E_{a_n} = E$ does not converge to $E_a = E_T$.

2. (A. Tserunyan) Take $\Gamma = \mathbb{F}_\infty$ with free generating set $\{\gamma_m\}_{m \in \mathbb{N}}$. Let $a$ be the usual shift action of $\Gamma$ on $2^{\Gamma}$ and $E_a$ the induced equivalence relation. Let $T$ be the measure preserving automorphism on $2^{\Gamma}$ such that $T(x)(\gamma) = 1 - x(\gamma)$, for all $\gamma \in \Gamma$. Let $a_n$ be the action of $\Gamma$ such that

$$\gamma_m^{a_n} = \begin{cases} \gamma_m^a & \text{if } m \leq n, \\ T & \text{if } m > n. \end{cases}$$

Let $E$ be large enough so that all $\gamma_m^a$, for all $\gamma \in \Gamma$, and $T$ are in $[E]$. Then $a_n \to a$ uniformly but $E_{a_n}$ does not converge to $E_a$, since $d(T, E_{a_n}) = 0$ but $d(T, E_a) = 1$.

3. (R. Tucker-Drob) Take $\Gamma = \mathbb{Z}$. Let $(S, T)$ be any free action of $\mathbb{Z}^2$ on $(X, \mu)$ and fix some ergodic equivalence relation $E$ whose full group contains the transformations $S$ and $T$. Fix also sequences $\epsilon_n > 0$, $\epsilon_n \to 0$ and $k_n \in \mathbb{N}$, $k_n \to \infty$. By the Rokhlin Lemma for $\mathbb{Z}^2$ actions, for each $n$ we can find a set $B_n = B \subseteq X$ such that the sets $S^iT^j(B)$, $0 \leq i, j < k_n$, are pairwise disjoint, and satisfy $\mu(C) > 1 - \epsilon_n$, where

$$C = \bigsqcup_{0 \leq i, j < k_n} S^iT^j(B).$$

Define the transformation $S_n$ as follows: view powers of the transformation $S$ as successively moving the block $B$ upward and view powers of $T$ as moving $B$ horizontally to the right. We thus have a square structure consisting of $k_n$-many rows and $k_n$-many columns, and where $B$ is in the bottom left corner.
Define $S_n$ to be equal to $S$ on all rows except for the top. On the top row define

$$S_n(x) = \begin{cases} \, TS^{-(k_n-1)}(x) & \text{if } x \in S^{k_n-1}T^j(B) \text{ where } j < k_n - 1, \\ \, T^{-(k_n-1)}S^{-(k_n-1)}(x) & \text{if } x \in S^{k_n-1}T^{k_n-1}(B). \end{cases}$$

Thus, on $C$, $S_n$ is a cyclic permutation of the blocks $\{S^iT^j(B)\}_{0\leq i,j<k_n}$ with $E_{S_n}|C \subseteq E_{S(T)}|C \subseteq E|C$. We extend $S_n$ to all of $X$ so that it has period $k_n^2$ and is in $[E]$. Then it is clear that $S_n \to S$ uniformly. Since $(S,T)$ defines a free action of $\mathbb{Z}^2$ we have $d(T,E_S) = 1 - \mu(\{x \in X : (x,T(x)) \in ES\}) = 1$. On the other hand, if $x \in C$ is in any column except the last, then $S_n^{k_n}(x) = T(x)$, so that $(x, T(x)) \in E_{S_n}$ and thus $d(T,E_{S_n}) = 1 - \mu(\{x : (x,T(x)) \in E_{S_n}\}) \to 0$. This shows that $E_{S_n}$ does not converge to $E_S$.

Assume now that $S$ is ergodic. We can use the sequence $\{S_n\}$ to define a new sequence $\{Q_n\} \subseteq [E]$ of ergodic transformations which converge uniformly to $S$ and also satisfy $\mu(\{x : T(x) = Q_n^{k_n}(x)\}) \to 1$, so that $E_{Q_n}$ does not converge to $E_S$ in $S(E)$. Let $\eta_n > 0$ be chosen so that $k_n \eta_n \to 0$. Since $E$ is ergodic, any two transformations in $[E]$ of period $k_n^2$ are isomorphic via an element of $[E]$, so by the Uniform Approximation Theorem (see [K], 3.3), for each $n$ there exists an ergodic transformation $Q_n \in [E]$ such that $d_u(S_n,Q_n) \leq \frac{1}{k_n^2} + \eta_n$. Then $Q_n \to S$ uniformly (since $S_n$ converges to $S$ uniformly), and $d_u(Q_n^{k_n},S_n^{k_n}) \leq k_n(\frac{1}{k_n^2} + \eta_n) = \frac{1}{k_n} + k_n \eta_n \to 0$, so $\mu(\{x : T(x) = Q_n^{k_n}(x)\}) \to 1$.

It turns out now that we have the following general fact.

**Theorem 6.5.** Let $E$ be ergodic. Let $\Gamma$ be a countable infinite amenable group. Then the map $a \in A(\Gamma,E) \mapsto E_a \in S(E)$ is not continuous.

**Proof.** By Dye and Ornstein-Weiss, let $T \in [E]$ be mixing and let $a \in A(\Gamma,E)$ be such that $E_a = E_T$. Let $S = T^2$. Then $S$ is ergodic and $E_S \nsubseteq E_T$. Again by Ornstein-Weiss, there is a free ergodic $b \in A(\Gamma,E)$ such that $E_b = E_S$. By Foreman-Weiss [FW, proof of Claim 19], there is a sequence $S_0,S_1,\ldots \in [E_a \vee E_b] = [E_a]$ such that $a_n = S_naS_n^{-1} \to b$ uniformly. But $E_{a_n} = E_a \neq E_b$. \hfill $\Box$

We now define a stronger topology than the uniform topology on $A(\Gamma,X,\mu)$ (see [K, Remark in page 103]). It is induced by the complete metric

$$\delta_{\Gamma,\infty}(a,b) = \sup_{\gamma \in \Gamma} d_u(\gamma^a,\gamma^b).$$

43
The main fact is that the map \( a \in A(\Gamma, E) \mapsto E_a \in S(E) \) is Lipschitz in the metrics \( \delta_{\Gamma, \infty}, \tau_{\infty} \) (defined in Section 3, (F)). Below denote by \([E]\) the **full pseudogroup** of \( E \), i.e., the set of all partial Borel bijections \( \varphi: A \to B \) with \( \varphi(x)E_{x}, \forall x \in A \). As usual we identify two such partial bijections if they agree \( \mu \)-a.e.

**Theorem 6.6.** For any countable group \( \Gamma \) and any \( a, b \in A(\Gamma, E) \),

\[
\tau_{\infty}(E_a, E_b) \leq 80\delta_{\Gamma, \infty}(a, b).
\]

In particular, \( a \in A(\Gamma, E) \mapsto E_a \in S(E) \) is continuous from the \( \delta_{\Gamma, \infty} \)-topology on \( A(\Gamma, E) \) to the uniform topology of \( S(E) \) (and thus to the topology of \( S(E) \)).

**Proof.** We will show that for any \( \delta > 0 \),

\[
\delta_{\Gamma, \infty}(a, b) < \frac{\delta^2}{2} \implies \tau_{\infty}(E_a, E_b) \leq 40\delta^2.
\]

Assume \( \delta_{\Gamma, \infty}(a, b) < \frac{\delta^2}{2} \) and fix \( T \in [E] \). By [K, Remark in page 103], there is \( \varphi: A \to B, \varphi \in [[E]] \) such that \( A \) is \( a \)-invariant, \( B \) is \( b \)-invariant, \( \varphi(a|A)\varphi^{-1} = b|B, \mu(A) > 1 - 16\delta^2 \) and \( \mu(\{x \in A: \varphi(x) \neq x\}) \leq 4\delta^2 \).

Put

\[
A' = \{x \in A: \varphi(x) = x\} = \{x \in B: \varphi^{-1}(x) = x\},
\]

\[
A'' = \{x \in A': T(x) \in A'\}.
\]

Suppose now that \((x, T(x)) \in E_a\) and \( x \in A'' \). Then there is \( \gamma \in \Gamma \) such that \( \gamma^a(x) = T(x) \), so, as \( x, T(x) \in A' \), we have

\[
\gamma^b(x) = \gamma^b(\varphi(x)) = \varphi(\gamma^a(x)) = \varphi(T(x)) = T(x),
\]

so \((x, T(x)) \in E_b\). Similarly let \((x, T(x)) \in E_b\) and \( x \in A'' \). Then there is \( \gamma \in \Gamma \) such that \( \gamma^b(x) = T(x) \), so, as \( x, T(x) \in A' \), we have

\[
T(x) = \varphi^{-1}(T(x)) = \varphi^{-1}(\gamma^b(x)) = \gamma^a(\varphi^{-1}(x)) = \gamma^a(x),
\]

thus \((x, T(x)) \in E_a\).

It follows that \( A_{T,E_a} \Delta A_{T,E_b} \subseteq X \setminus A'' \), and, since \( A'' = A' \cap T^{-1}(A') \), we have \( \mu(X \setminus A'') \leq 2\mu(X \setminus A') \). Also \( X \setminus A' \subseteq (X \setminus A) \cup \{x \in A: \varphi(x) \neq x\} \), so \( \mu(X \setminus A') < 16\delta^2 + 4\delta^2 = 20\delta^2 \). Thus \( \mu(A_{T,E_a} \Delta A_{T,E_b}) < 40\delta^2 \) and, since \( T \) was arbitrary, \( \tau_{\infty}(E_a, E_b) \leq 40\delta^2 \). \( \square \)

44
It is known that when $\Gamma$ has property (T) the $\delta_{\Gamma,\infty}$-topology on $A(\Gamma, E)$ coincides with the (uniform) topology of $A(\Gamma, E)$ (see again [K, Remark in page 103]), so we have the following result originally proved by R. Tucker-Drob:

**Corollary 6.7** (R. Tucker-Drob). If $\Gamma$ has property (T), then the map $a \in A(\Gamma, E) \mapsto E_a \in S(E)$ is continuous.

In view of Theorem 6.5 and Corollary 6.7, one can consider the following more precise version of Problem 6.4.

**Problem 6.8.** Let $\Gamma$ be an infinite group. Is it true that the map $a \in A(\Gamma, E) \mapsto E_a \in S(E)$ is continuous for every $E$ iff the group $\Gamma$ has property (T).

Finally we have:

**Proposition 6.9.** Assume $a_n \to a$ in $A(\Gamma, E)$ and for every $T \in [E],$

$$\mu(\{x : \neg T(x)E_a x \land T(x)E_{a_n} x\}) \to 0.$$ 

Then $E_{a_n} \to E_a$. In particular this holds if $E_{a_n} \subseteq E_a$.

**Proof.** We have to show that for $T \in [E], d(T, E_{a_n}) \to d(T, E_a)$.

Let now $U \in [E_a]$ be such that

$$T(x)E_a x \Rightarrow U(x) = T(x) \text{ (therefore } d(T, E_a) = d(U, T))$$

Let

$$B_n = \{x : \neg T(x)E_{a_n} x \land T(x)E_a x\}$$
$$C_n = \{x : T(x)E_{a_n} x \land U(x)E_{a_n} x \land \neg T(x)E_a x\}$$
$$D_n = \{x : T(x)E_{a_n} x \land \neg U(x)E_{a_n} x \land \neg T(x)E_a x\}$$
$$E_n = \{x : \neg T(x)E_{a_n} x \land U(x)E_{a_n} x \land \neg T(x)E_a x\}$$
$$F_n = \{x : \neg T(x)E_{a_n} x \land \neg U(x)E_{a_n} x \land \neg T(x)E_a x\}.$$

Let $b_n, c_n, d_n, e_n, f_n$ be the measure of these sets, resp.

Then

$$d(T, E_{a_n}) = b_n + e_n + f_n$$
$$d(U, E_{a_n}) = b_n + d_n + f_n$$
and
\[ d(T, E_a) = c_n + d_n + e_n + f_n \]

Therefore \[ d(T, E_{a_n}) - d(T, E_a) = b_n - c_n - d_n. \]

Now as \[ d(U, E_{a_n}) \to 0 \] (by the Claim in Proposition 6.2), we have that \[ b_n + d_n \to 0. \]

So it is enough to show that \( c_n \to 0. \) But

\[
C_n = \{ x : T(x)E_{a_n}x \& U(x)E_{a_n}x \& \neg T(x)E_{a}x \}
\subset \{ x : T(x)E_{a}x \& \neg T(x)E_{a}x \},
\]

so \( c_n \to 0 \) by hypothesis. \qed
7 Complexity calculations

We now discuss the complexity of various classes of equivalence relations. For any class \( \mathcal{R} \) of (measure preserving countable Borel) equivalence relations and any given such relation \( E \), we denote by

\[
\mathcal{R}_E = \mathcal{R} \cap S(E)
\]

the set of subequivalence relations of \( E \) that are in the class \( \mathcal{R} \). In particular \( \mathcal{E}_E = S(E) \). Recall that an equivalence relation is finite if all its equivalence classes are finite and hyperfinite if it is the union of an increasing sequence of finite equivalence relations.

**Theorem 7.1.** Let \( \mathcal{H} \) be the class of hyperfinite equivalence relations. Then \( \mathcal{H}_E \) is closed in \( S(E) \).

**Proof.** By Theorem 4.2.

Denote by \( \mathcal{F} \), resp., \( \mathcal{BF} \) the classes of equivalence relations which are finite, resp., bounded finite (i.e., for some \( N \) each equivalence class has at most \( N \) elements). It follows that

\[
\overline{\mathcal{F}_E} = \overline{\mathcal{BF}_E} = \mathcal{H}_E.
\]

In particular, \( E \) is hyperfinite iff \( \mathcal{F}_E \) is dense in \( S(E) \) iff \( \mathcal{BF}_E \) is dense in \( S(E) \).

Next we calculate the complexity of the class of aperiodic (i.e., having infinite classes) equivalence relations.

**Theorem 7.2.** Let \( \mathcal{A} \) be the class of aperiodic equivalence relations. Then \( \mathcal{A}_E \) is a \( G_\delta \) set in the topology of \( S(E) \). Moreover, if \( E \) is aperiodic, then \( \mathcal{A}_E \) is dense.

**Proof.** Let \( \{T_n\} \subseteq [E] \) be a sequence of aperiodic automorphisms which is dense in the set of aperiodic elements of \([E]\). We claim that the following are equivalent for \( F \in S(E) \):

1. \( F \) is aperiodic,
2. \( \forall \epsilon \in \mathbb{Q}^+ \exists n(d(T_n, F) < \epsilon) \),

47
which clearly shows that the class of aperiodic elements of $S(E)$ is $G_{\delta}$. 

(1) $\Rightarrow$ (2). By [K], 3.5, $[F]$ contains an aperiodic $T$. Then for each $\epsilon \in \mathbb{Q}^+$ there is $n$ such that $d(T_n, T) < \epsilon$, so $d(T_n, [F]) < \epsilon$.

(2) $\Rightarrow$ (1). Assume (2) and also that (1) fails, towards a contradiction. Then there is $N \in \mathbb{N}^+$ such that if $A = \{x: |[x]_E| = N\}$, then $\mu(A) = a > 0$.

Choose $n$ so that $d(T_n, F) < \frac{a}{2(N+1)^2}$ and let $T \in [F]$ be such that $d(T_n, T) < \frac{a}{2(N+1)^2}$. Now note that for $i \leq N$, $d(T_i, T^i) \leq \frac{ia}{2(N+1)^2} \leq \frac{(N+1)a}{2(N+1)^2}$, so $\mu(\{x: \exists i \leq N(T^i(x) \neq T_n(x))\} \leq \frac{(N+1)^2a}{2(N+1)^2} = \frac{a}{2}$. Therefore if $B = \{x: \forall i \leq N(T^i(x) = T_n(x))\}$, then $\mu(B) \geq 1 - \frac{a}{2}$, so $\mu(A \cap B) > 0$.

If $x \in A \cap B$, then $T^i(x) = T_n(x)$, for $i \leq N$, so $N = |[x]_F| \geq |\{T^i(x): i \leq N\}| = |\{T_n(x): i \leq N\}| = N + 1$, a contradiction.

Finally we prove that $A_E$ is dense in $S(E)$, if $E$ is aperiodic. For that it is enough to show that if $F \in S(E)$ is finite, then there is a sequence $F_0 \supseteq F_1 \supseteq \ldots$ with $F_n \in A_E$ and $\bigcap_n F_n = F$. Let $Y$ be a Borel transversal for $F$.

Note now that if $R$ is an aperiodic equivalence relation, then there is a sequence of aperiodic $R \supseteq R_0 \supseteq R_1 \supseteq \ldots$ such that $\bigcap R_n = id$ (the equality equivalence relation). To see this, let $T \in [R]$ be aperiodic and let $R_n$ be the equivalence relation generated by $T^{2^n}$, $n = 0, 1, 2, \ldots$. Apply this now to $R = E|Y$ to find $R_n$ as above and let $F_n = R_n \cap F$.  

We also have the following calculation concerning the Marker Lemma (see, e.g., [KM, Lemma 6.7]).

**Proposition 7.3.** There is a Borel function $\Xi: A_E \to \text{MALG}^N$ such that for each $F \in A_E$, $\Xi(F)_0 \supseteq \Xi(F)_1 \supseteq \ldots$, $\mu(\Xi(F)_n) \to 0$ and each $\Xi(F)_n$ is a complete section of $F$.

**Proof.** Use Proposition 3.17 and the proof of the Marker Lemma as in, e.g., [KM, Lemma 6.7].  

It is clear that $\mathcal{B}_E$ is $F_0$ in the topology of $S(E)$ and it is dense if $E$ is hyperfinite. Moreover if $E$ is aperiodic, so that $S(E) \setminus \mathcal{B}_E$ is dense by Theorem 7.2, it follows that $\mathcal{B}_E$ is in $F_0 \setminus G_\delta$ in the topology of $S(E)$ for $E$ aperiodic, hyperfinite. It follows from Theorem 5.1 that if $E \subseteq F$, then the topology on $S(E)$ is the relative topology it inherits from $S(F)$. Since every aperiodic $E$ contains an aperiodic, hyperfinite subequivalence relation, we have the following:
Theorem 7.4. For every aperiodic $E$, $\mathcal{B}_E$ is in $F_\sigma \setminus G_\delta$ and $\mathcal{A}_E$ is in $G_\delta \setminus F_\sigma$ in the topology of $S(E)$.

Theorem 7.5. The set $\mathcal{F}_E$ of finite equivalence relations in $S(E)$ is $F_\sigma \delta$ in the topology of $S(E)$.

Proof. The proof is a variation of that of Theorem 7.2. Since every equivalence relation is included in an aperiodic one, by the paragraph preceding Theorem 7.4, we can assume that $E$ is aperiodic.

First note that for each open set $V \subseteq [E]$, the set $\{F \in S[E] : [F] \cap V \neq \emptyset\}$ is open in the weak topology of $S(E)$. To see this, let $V = \bigcup_n \{T \in [E] : d(T, T_n) < \epsilon_n\}$, for some sequence $\{T_n\} \in [E]^\mathbb{N}$ and sequence $(\epsilon_n)$ of positive reals. Then $[F] \cap V \neq \emptyset \iff \exists n(d(T_n, F) < \epsilon_n)$, so the above set is clearly open.

Below let $A(E)$ be the set of aperiodic elements of $[E]$. We claim that the following are equivalent for $F \in S(E)$:

1. $F$ is not finite,

2. $\exists a \in \mathbb{Q}^+ \forall N \in \mathbb{N}^+ \exists S \in A(E)$
   
   $\exists T \in [F] [\mu(\{x : \forall i \leq N(S^i(x) = T^i(x))\}) > a]$.

Granting this, it is enough to see that the expression in the second line of (2) above defines an open set of $F$’s (for each fixed $S$). Let

$$V = \{T \in [E] : \mu(\{x : \forall i \leq N(S^i(x) = T^i(x))\}) > a\}.$$ 

Clearly $V \subseteq [E]$ is open and this expression is equivalent to $[F] \cap V \neq \emptyset$, which by the above defines an open set of $F$’s.

We finally prove the equivalence of (1) and (2).

(1) $\Rightarrow$ (2). Assume that $F$ is not finite. Let $A$ be an $F$-invariant Borel set of positive measure with $F|A$ aperiodic and let $a \in \mathbb{Q}^+$ be such that $\mu(A) > a$. Let $T_0 \in [F|A]$ be aperiodic and let $T \in [F]$ be such that $T|A = T_0|A$. Let also $S \in A(E)$ be such that $T|A = S|A$. Then for each $N \in \mathbb{N}^+$, $x \in A$, we have that $S^i(x) = T^i(x), \forall i \leq N$, so $\mu(\{x : \forall i \leq N(S^i(x) = T^i(x))\}) > a$. 

49
(2) \rightarrow (1). Assume that (2) is true and fix \( a \in \mathbb{Q}^+ \) witnessing that. If (1) fails, towards a contradiction, find \( N \in \mathbb{N}^+ \) large enough so that 
\[
\mu(\{x: |[x]| \leq N\}) > 1 - a. \quad \text{Then find} \quad S \in A(\sigma), T \in [F] \quad \text{so that} \quad \mu(\{x: \forall i \leq N(S^i(x) = T^i(x))\}) > a. \quad \text{Thus there is} \quad x \quad \text{so that} \quad |[x]| \leq N \quad \text{but} \quad S^i(x) = T^i(x), \quad \text{for} \quad i \leq N. \quad \text{Then} \quad N \geq |[x]| \geq |\{T^i(x): i \leq N\}| = |\{S^i(x): i \leq N\}| = N + 1, \quad \text{a contradiction.} \quad \square

**Problem 7.6.** If \( E \) is aperiodic, is \( \mathcal{F}_E \) in \( F_{\sigma\delta} \setminus G_{\delta\sigma} \) for the topology of \( S(E) \)?

The following provides an affirmative answer when \( E \) is ergodic.

**Theorem 7.7.** If \( E \) is ergodic, then \( \mathcal{F}_E \) is in \( F_{\sigma\delta} \setminus G_{\delta\sigma} \) for the topology of \( S(E) \).

*Proof.* First notice that for any aperiodic \( E, \mathcal{F}_E \) is not \( G_{\delta} \) in the topology of \( S(E) \). To see this, we can assume, by the paragraph preceding 7.4, that \( E \) is aperiodic, hyperfinite. In this case \( \mathcal{F}_E \) is dense and disjoint from the dense \( G_{\delta} \) set \( A_E \), so it cannot be \( G_{\delta} \). It follows (see [K2], 21.18 and proof of 22.10) that for any aperiodic \( E, \mathcal{F}_E \) is \( F_{\sigma\delta} \)-hard, i.e., for each \( F_{\sigma} \) subset \( A \subseteq Y, Y \) a zero-dimensional Polish space, there is a continuous function \( f: Y \rightarrow S(E) \) such that \( y \in A \iff f(y) \in \mathcal{F}_E \).

Since every ergodic \( E \) contains an ergodic, hyperfinite subequivalence relation, we can assume as before that \( E \) is ergodic, hyperfinite. Since every aperiodic, hyperfinite equivalence relation is contained in an ergodic, hyperfinite equivalence relation (see [K], Lemma 5.4) and all ergodic, hyperfinite equivalence relations are isomorphic by Dye’s Theorem, it is enough to find some aperiodic, hyperfinite equivalence relation \( E \) such that this theorem holds for \( E \).

Given a sequence of measure preserving equivalence relations \( \mathcal{E}_n \) on \((X, \mu)\), define their **direct sum**, in symbols \( \bigoplus_n E_n \), as follows: Let \( Y = \bigcup_n X_n \) be the direct sum of infinitely many copies of \( X \). On each \( X_n \) put a copy \( \mu_n \) of the measure \( \mu \) and define the measure \( \nu \) on \( Y \) by \( \nu = \sum_n \frac{1}{2^{n+1}} \mu_n \).

Then put on each \( Y_n \) a copy \( E'_n \) of \( E_n \), and let \( \bigoplus_n E_n = \bigcup_n E'_n \). Clearly \( \bigoplus_n E_n \) is a measure preserving equivalence relation on \((Y, \nu)\). Moreover the map \( \prod_n S(E_n) \rightarrow S(\bigoplus_n E_n) \) given by \( (F_n) \mapsto \bigoplus_n F_n \) is a homeomorphism of \( \prod_n S(E_n) \) with \( S(\bigoplus_n E_n) \), each equipped with the weak topology. Moreover, under this homeomorphism \( \prod_n \mathcal{F}_{E_n} \) goes to \( \mathcal{F}_{\bigoplus_n E_n} \).

Take now each \( E_n \) to be aperiodic, hyperfinite, so that \( E = \bigoplus_n E_n \) is also aperiodic, hyperfinite. Then each \( \mathcal{F}_{E_n} \) is \( F_{\sigma\delta} \)-hard and so \( \prod_n \mathcal{F}_{E_n} \) is \( \mathcal{F}_{\sigma\delta} \)-hard and thus \( \mathcal{F}_E \) is also \( \mathcal{F}_{\sigma\delta} \)-hard, which completes the proof. \( \square \)
Let $\mathcal{T}$ be the class of treeable equivalence relations and let $\mathcal{D}_n, n = 1, 2, \ldots$, be the class of equivalence relations that have geometric dimension $\leq n$, i.e., can be Borel reduced (a.e.) to a $\mathcal{K}_n$-structurable Borel equivalence relation, where $\mathcal{K}_n$ is the class of $n$-dimensional contractible simplicial complexes (see Gaboriau [G1, 3.18], and Hjorth-Kechris [HK, Appendix D]). Thus $\mathcal{D}_1 = \mathcal{T}$. Gaboriau [G1, 5.8], shows that $\mathcal{D}_n$ is hereditary and by [G1, 3.17], if $E \in \mathcal{D}_n$, then $\beta_p(E) = 0$, if $p > n$, where $\beta_p$ is the $p$-th $L^2$-Betti number. Recall also from [G1, 3.16], that if $F$ is induced by a free measure preserving action of $(\mathbb{F}_2)^n$ (a.e.) then no $\mathcal{D}_{n,E}$ is dense in the topology of $S(E)$.

**Problem 7.8.** Let $\mathcal{D}_\infty = \bigcup_n \mathcal{D}_n$. Is $\mathcal{D}_{\infty,E}$ dense in the topology of $S(E)$ (for large enough $E$)?

We also note that for $n \geq 1, (\mathcal{D}_n)_{\uparrow} \neq \mathcal{D}_n$, thus no $\mathcal{D}_{n,E}$ is closed in the topology of $S(E)$ (if $E$ is large enough). To see this, let $F_2$ be the equivalence relation induced by the shift action of $\mathbb{F}_2$ and let $F_1$ be the equivalence relation induced by the shift action of $Z = \bigoplus_n (\mathbb{Z}/2)^n$. Then $F = (F_2)^n \times F_1$, is induced by a free measure preserving action of $(\mathbb{F}_2)^n \times Z$. Gaboriau (see [G2, 7.3]) has shown that the ergodic dimension of $(\mathbb{F}_2)^n \times Z$ is $n + 1$. Recall that the **ergodic dimension** of a group is the minimum of the geometric dimensions of the equivalence relations given by free measure preserving actions of the group. It follows that the geometric dimension of $F$ is $\geq n + 1$, thus $F \notin \mathcal{D}_n$. On the other hand it is easy to see (see, e.g., [HK, page 62]) that $F \in (\mathcal{D}_n)_{\uparrow}$.

Finally notice that by [G2, 7.3], (a), $(\mathcal{D}_n)_{\uparrow} \subseteq \mathcal{D}_{n+1}$, so for every $E$, $\mathcal{D}_{\infty,E} = \bigcup_n \mathcal{D}_{n,E} = \bigcup_n \mathcal{D}_{n,E}$ is an $F_\sigma$ set.
Problem 7.9. What is the descriptive complexity of each $D_{n,E}, n \geq 1$, in the topology of $S(E)$ (for large enough $E$)? Is $D_{\infty,E}$ a true $F_\sigma$ set?

We will see later in Corollary 18.5 that $T_E$ is analytic in $S(E)$ but it is not known if it is Borel; see Problem 18.6.
8  Finite and infinite index subrelations

Denote by \( \text{FinIndex}(E) \) (resp., \( \text{InfIndex}(E) \)) the set of all \( F \in S(E) \) such that \( [E : F] < \infty \), i.e., every \( E \)-class contains only finitely many \( F \)-classes (resp., \( [E : F] = \infty \), i.e., every \( E \)-class contains infinitely many \( F \)-classes).

**Proposition 8.1.** The set \( \text{InfIndex}(E) \) is \( G_\delta \) in \( S(E) \) and it is dense if \( E \) is aperiodic.

**Proof.** Let \( (T_i) \) be a generating sequence for \( E \). Then the following are equivalent for \( F \in S(E) \):

(i) \( F \in \text{InfIndex}(E) \),

(ii) \( \forall n \forall k > 0 \exists M (\mu(\{x : \exists m \leq M \forall i \leq n T_m(x) \neq T_i(x)\}) > 1 - \frac{1}{k}) \).

Let

\[
B_{F,M,n} = \bigcup_{m \leq M} \bigcap_{i \leq n} (X \setminus T_i^{-1}(A_{T_m \cap T_i^{-1}})).
\]

Then

\[
\text{InfIndex}(E) = \bigcap_n \bigcap_{k>0} \bigcup_M \{F : \mu(B_{F,M,n}) > 1 - \frac{1}{k}\}.
\]

Since \( F \mapsto \mu(B_{F,M,n}) \) is continuous, this shows that \( \text{InfIndex}(E) \) is \( G_\delta \).

Assume now that \( E \) is aperiodic and let \( A_0 \supseteq A_1 \supseteq \ldots \) be Borel sets which are complete sections of \( E \) and \( \mu(A_n) \to 0 \). Given \( F \in S(E) \), let \( F_n = F| (X \setminus A_n) \cup \text{id}|A_n \). Then \( (F_n) \) is increasing and \( F = \bigcup F_n \), so \( F_n \to F \). Since each \( A_n \) meets every \( E \)-class in an infinite set, there are infinitely many \( F_n \)-classes in each \( E \)-class, i.e., \( F_n \in \text{InfIndex}(E) \). \( \square \)

**Remark 8.2.** A similar calculation gives another way to show that \( \mathcal{A}_E \) is \( G_\delta \) is \( S(E) \) (see Theorem 7.2). Indeed as in the proof of Proposition 8.1, put \( C_{i,m} = \{x : T_i(x) \neq T_m(x)\} \) and \( D_{F,M,n} = \bigcup_{m \leq M} \bigcap_{i \leq n} (C_{i,m} \cap A_{F,T_m}) \). Then \( \mathcal{A}_E = \bigcap_n \bigcap_{k>0} \bigcup_M \{F : \mu(D_{F,M,n}) > 1 - \frac{1}{k}\} \) and since \( F \mapsto D_{F,M,n} \) is again continuous, \( \mathcal{A}_E \) is \( G_\delta \).

**Proposition 8.3.** The set \( \text{FinIndex}(E) \) is \( F_{\sigma\delta} \) in \( S(E) \). If \( E \) is aperiodic, hyperfinite, then it is also dense.

**Proof.** Let \( (T_i) \) be a generating sequence for \( E \). Let

\[
L_{F,M,n} = \{x : \forall i \leq n \exists m \leq M(T_i(x) \neq T_m(x))\}.
\]
Then
\[ \text{FinIndex}(E) = \bigcap_{k>0} \bigcup_{M,n} \{ F : \mu(L_{F,M,n}) \geq 1 - \frac{1}{k} \} \]
and since the map \( F \mapsto L_{F,M,n} \) is continuous, this shows that \( \text{FinIndex}(E) \) is \( F_{\sigma\delta} \).

Assume now that \( E \) is aperiodic, hyperfinite. It is enough to approximate every smooth \( F \in S(E) \) by finite index subrelations of \( E \). Let \( Y \) be a Borel transversal for \( F \). Then \( E|Y \) is aperiodic (on \( Y \)), so there is aperiodic \( S \in [E|Y] \) which generates \( E|Y \). Let \( F_n = F \vee E_S \) (note that \( E_S \) is an equivalence relation on \( Y \), which we can view as an equivalence relation on \( X \) but extending it by equality outside \( Y \)). Then \( (F_n) \) is decreasing, \( F_n \in \text{FinIndex}(E) \) and \( F_n \to F \).

In particular, it follows that if \( E \) is aperiodic, hyperfinite, then the set \( \text{InfIndex}(E) \) is in \( G_{\delta} \setminus F_{\sigma} \). This is also true if \( E \) admits invariant Borel sets of arbitrarily small measure. Because if \( A \) is Borel invariant of small measure, then we can approximate \( F \in S(E) \) by \( F|(X \setminus A) \sqcup E|A \), which is not in \( \text{InfIndex}(E) \).

**Problem 8.4.** Let \( E \) be aperiodic. Is \( \text{InfIndex}(E) \) in \( G_{\delta} \setminus F_{\sigma} \)?

Since for \( E \) aperiodic, hyperfinite, \( \text{FinIndex}(E) \) is not \( G_{\delta} \) it is \( F_{\sigma} \)-hard. Then, as in the proof of Theorem 7.7, one can find some aperiodic, hyperfinite \( E \) such that \( \text{FinIndex}(E) \) is in \( F_{\sigma\delta} \setminus G_{\delta\sigma} \).

**Problem 8.5.** Assume \( E \) is aperiodic. Is the set \( \text{FinIndex}(E) \) in \( F_{\sigma\delta} \setminus G_{\delta\sigma} \)?

We next show that \( \text{FinIndex}(E) \) is not always dense in \( S(E) \).

**Theorem 8.6.** There is an ergodic \( E \) such that \( \text{FinIndex}(E) \) is not dense in \( S(E) \).

**Proof.** Let \( \Gamma \) be an infinite property (T) group all of whose proper subgroups are finite (such groups exist by a result of Olshanski, see [DC, Proposition 2] and [O, Corollary 4]). Consider the shift action of \( \Gamma \) on \( X = [0,1]^\Gamma \) and denote by \( E \) the associated equivalence relation. We will show that this works.

Call \( F \in \text{FinIndex}(E) \) **degenerate** if there is a Borel partition \( X = A_0 \sqcup A_1 \sqcup \cdots \sqcup A_{n-1} \) into sets of positive measure such that
\[ xFy \iff xEy \text{ and } \exists i < n(x, y \in A_i). \]
Such an $F$ is denoted by $E_{A_0, A_1, \ldots, A_{n-1}}$.

The next fact strengthens the last part of Bowen [Bo1, Theorem 1.1].

**Lemma 8.7.** If $F \in \text{FinIndex}(E)$, then $F$ is degenerate.

**Proof.** Let $[E : F] = n$ be the index of $F$ in $E$, i.e., the number of $F$-classes in each $E$-class. Let also $(\varphi_i)_{i < n}$ be a choice sequence for $F$ in $E$, i.e., a sequence of Borel functions such that for each $x$, $([\varphi_i(x)]_F)_{i < n}$ is an injective enumeration of the $F$-classes in $[x]_E$. Let also $\sigma : E \to S_n$ (= the symmetric group of $n$ elements) be the associated index cocycle defined by

$$\sigma(x, y)(i) = j \iff \varphi_i(x)F \varphi_j(y).$$

This of course can also viewed as a cocycle of the shift action of $\Gamma$ into $S_n$, so by Popa superrigidity, see [Po], it is cohomologous to a homomorphism from $\Gamma$ into $S_n$, which, since $\Gamma$ has no proper finite index subgroups, must be trivial, i.e., $\sigma$ is a coboundary and so by [FSZ, Proposition 1.7], $F$ is degenerate. 

Call $F \in S(E)$ relatively smooth, resp., relatively hypersmooth, if there is a smooth (resp., hypersmooth) Borel equivalence relation $R$ such that $F = E \cap R$.

**Lemma 8.8.** If $F \in S(E)$ is the limit of a sequence of degenerate relations, then $F$ is relatively hypersmooth.

**Proof.** Let $F_i = E_{A_0, A_1, \ldots, A_{n_i-1}}$ be such that $F_i \to F$. Then by Theorem 4.1, for each $i$, there is an increasing sequence $n_0^{(i)} < n_1^{(i)} < \ldots$, so that $(n_m^{(i+1)})_{m \in \mathbb{N}}$ is a subsequence of $(n_m^{(i)})_{m \in \mathbb{N}}$ and

$$F = \bigcup_{m} \bigcap_{k \geq m} F_{n_k^{(m)}}.$$

Put $R_m = \bigcap_{k \geq m} F_{n_k^{(m)}}$. Then $R_0 \subseteq R_1 \ldots$ and $F = \bigcup_m R_m$. Define for each $m$,

$$f_m : X \to \mathbb{N}^\mathbb{N}$$

by

$$f_m(x)(i) = n \iff x \in A_{n_m^{(m)}}^{n_m^{(m)}}.$$

Then if

$$xS_m y \iff f_m(x) = f_m(y),$$

55
we have $R_m = E \cap S_m$. Also $S_0 \subseteq S_1 \subseteq \ldots$ and $F = \bigcup_m R_m = E \cap (\bigcup_m S_m)$ and $\bigcup_m S_m$ is hypersmooth.

By a result of Gaboriau-Lyons [GL], there is a free, measure preserving, ergodic action of $F_2$ whose induced equivalence relation $F$ is in $S(E)$. Then by the result of Chifan-Ioana [CI], $F$ is strongly ergodic (see Section 9, (B) for the definition of strong ergodicity). We claim that $F$ cannot be the limit of a sequence of degenerate relations, thus it is not in the closure of $\FinIndex(E)$. Otherwise, by Lemma 8.8, we would have $F = E \cap R$, with $R$ hypersmooth, say $R = \bigcup_n R_n$, with $(R_n)$ increasing and each $R_n$ smooth. Let $f_n : X \to 2^N$ be Borel such that $xR_n y \iff f_n(x) = f_n(y)$. Let $F_n = E \cap R_n$, so that $(F_n)$ is increasing and $F = \bigcup_n F_n$. By a result of Gaboriau [G2, Proposition 5.2], there is $n$ and a $F_n$-invariant Borel set $A$ of positive measure such that $F_n|A$ is ergodic. Since $f_n|A$ is $F_n|A$-invariant, it is constant, so $F_n|A = E|A$ and thus $F_n|A \subseteq F|A \subseteq E|A = F_n|A$, i.e, $F|A = E|A$. But $F|A$ is treeable, so $E|A$ is treeable and, since $A$ is a complete section for $E$, $E$ is treeable, contradicting the result of Adams and Spatzier [AS].

**Remark 8.9.** For an arbitrary $E$, it is the case that $F \in S(E)$ is relatively hypersmooth iff $F$ is the limit of a sequence of degenerate relations. One direction is proved as in Lemma 8.8 (which did not use any particular properties of $E$). For the other direction it is enough to show that every relatively smooth $F \in S(E)$ is the limit of degenerate relations. Indeed, let $R$ be smooth such that $F = E \cap R$ and let $f : X \to 2^N$ be a Borel function such that $xRy \iff f(x) = f(y)$. For $s \in 2^n, n \in \mathbb{N} \setminus \{0\}$, let $N_s = \{x \in 2^N : x|n = s\}$ and $A_s = f^{-1}(N_s)$. Consider then, for each $n > 0$, the degenerate relation $F_n$ determined by the partition $\{A_s\}_{s \in 2^n}$. Clearly $F_1 \supseteq F_2 \supseteq F_3 \supseteq \ldots$ and $F = \bigcap_n F_n$, so $F$ is the limit of the sequence $(F_n)$.

**Problem 8.10.** For what ergodic $E$ is $\FinIndex(E)$ dense in $S(E)$?

**Remark 8.11.** In Vaes [Va] and Bowen [Bo1] examples are given of ergodic equivalence relations that do not have proper finite index ergodic subequivalence relations or proper finite index extensions.

**Remark 8.12.** In Popa [Po, Section 6.6] it is suggested that it might be possible that the cocycle superrigidity proved in that paper could be extended.
to target groups that are closed subgroups of the (infinitary) unitary group $U(H)$. One can see however that this fails for the infinite symmetric group $S_\infty$, which is a closed subgroup of $U(H)$. Indeed let $\Gamma, E$ be as in the proof of Theorem 8.6. Let $F \in S(E)$ be ergodic, hyperfinite, so that $[E : F] = \infty$. Let $(\varphi_i)_{i<\infty}$ be a choice sequence for $F$ in $E$ and let $\sigma$ be the associated index cocycle, which now takes values in $S_\infty$. Assume, towards a contradiction, that this is cohomologous to a homomorphism $\pi: \Gamma \to S_\infty$. Thus there is a Borel map $p: X \to S_\infty$ such that

$$\sigma(x, \gamma \cdot x) = p(\gamma \cdot x)\pi(\gamma)p(x)^{-1}.$$ 

Put $\psi_i(x) = \varphi_p(x)(i)(x)$, so that $(\psi_i)$ is also a choice sequence with associated index cocycle $\tau(x, \gamma \cdot x) = \pi(\gamma)$, so that $\psi_i(x)F\psi_{\pi(\gamma)(i)}(\gamma \cdot x)$. Since $\forall x \exists i(\psi_i(x)Fx)$, fix $i_0$ such that if $A = \{x: \psi_{i_0}(x)Fx\}$, then $A$ has positive measure. By the ergodicity of $F$, $A$ meets every $F$-class infinitely often.

Now if $x, \gamma \cdot x \in A$ and $xF\gamma \cdot x$, we have

$$xF\psi_{i_0}(x)F\psi_{\pi(\gamma)(i_0)}(\gamma \cdot x)F\gamma \cdot x F\psi_{i_0}(\gamma \cdot x)$$

so

$$\psi_{\pi(\gamma)(i_0)}(\gamma \cdot x) F \psi_{i_0}(\gamma \cdot x),$$

thus $\pi(\gamma)(i_0) = i_0$. It follows that

$$\Delta = \{\gamma : \pi(\gamma)(i_0) = i_0\}$$

is an infinite subgroup of $\Gamma$, so $\Delta = \Gamma$; i.e., $\forall \gamma \in \Gamma(\pi(\gamma)(i_0) = i_0)$. Then

$$\psi_{i_0}(x)F\psi_{\pi(\gamma)(i_0)}(\gamma \cdot x) = \psi_{i_0}(\gamma \cdot x),$$

so $x \mapsto \psi_{i_0}(x)$ is a homomorphism of $E$ into $F$. Since $E$ is strongly ergodic and $F$ is hyperfinite, this maps a.e. to a single $F$-class, which is a contradiction, since $\psi_{i_0}(x)Ex$.

More generally, one can show that if $E$ is induced by a free, measure preserving, ergodic action of a countable infinite group $\Gamma$ on a standard measure space $(X, \mu)$, if $F \in S(E)$ is aperiodic and the index cocycle of $F$ in $E$ is cohomologous to a homomorphism, then there is a Borel decomposition $X = \bigsqcup_n X_n$ and infinite subgroups $\Delta_n$ of $\Gamma$ such that if $E_n$ is the equivalence relation induced by the restriction of the action to $\Delta_n$, then $E_n|X_n = F|X_n$. 

57
9 Ergodic and strongly ergodic equivalence relations

(A) Ergodic equivalence relations. We first calculate the complexity of the set of ergodic equivalence relations in $S(E)$. We denote by $\mathcal{ERG}$ the class of (measure preserving countable Borel) equivalence relations which are ergodic.

**Theorem 9.1.** The set $\mathcal{ERG}$ of ergodic equivalence relations in $S(E)$ is $G_\delta$ in $S(E)$.

**Proof.** We will give two proofs based, resp., in two descriptions of the topology of $S(E)$ given in Section 3, (D).

(1) (with R. Tucker-Drob) In the notation of Section 3, (D), we have the following fact:

**Lemma 9.2.** The set $\mathcal{ERG} = \{\mu \in \mathcal{M}: \mu \text{ is } R\text{-invariant, ergodic}\}$ is $G_\delta$ in $\mathcal{M}$.

**Proof.** The set $\{\mu \in \mathcal{M}: \mu \text{ is } R\text{-invariant}\}$ is compact, convex and, since $R$ is a countable Borel equivalence relation, the ergodic measures in $\{\mu \in \mathcal{M}: \mu \text{ is } R\text{-invariant}\}$ are exactly its extreme points, which clearly form a $G_\delta$ set.

Then $\mathcal{ERG} = \Phi^{-1}(\mathcal{ERG})$ and since $\Phi: S(E) \to \mathcal{M}$ is continuous, $\mathcal{ERG}$ is $G_\delta$ in $S(E)$.

(2) (P. Burton) In the notation of Section 3, (D), we note that if $\mathcal{ERG}(F, X, \mu)$ is the set of ergodic actions in $A(F, X, \mu)$, then we have that $\mathcal{ERG}(F, X, \mu)$ is $G_\delta$ in the weak topology of $A(F, X, \mu)$ (see [K, Proposition 12.1]) and thus it is also $G_\delta$ in the uniform topology. Since $\Psi$ is a homeomorphism between $S(E)$ and a closed subspace of $A(F, X)$ with the uniform topology and for $F \in S(E)$, $F = E_\Psi(F)$, we have that $\mathcal{ERG} = \Psi^{-1}(\mathcal{ERG}(F, X, \mu))$, so $\mathcal{ERG}$ is $G_\delta$ in $S(E)$.

(B) Strongly ergodic equivalence relations. An equivalence relation $F$ is called **strongly ergodic** or $E_0$-ergodic iff for any Borel homomorphism $\pi: X \to Y$ from $F$ to a hyperfinite equivalence relation $R$ on $Y$ (i.e., $xFx' \implies \pi(x)R\pi(x')$), there is $y \in Y$ such that $\pi^{-1}([y]_R)$ has measure 1. By a result of Jones-Schmidt this is equivalent to the non-existence of non-trivial
almost invariant sets for $F$ (see, e.g., [HK, Theorem A2.2], in which the hypothesis of ergodicity is unnecessary). We denote the class of all (measure preserving countable Borel) equivalence relations that are strongly ergodic by $E_0^RG$.

We call an equivalence relation $F$ **anti-$E_0$-ergodic** if there is homomorphism $\pi$ as above to a hyperfinite equivalence relation for which all preimages of $F$-classes are null. Denote by $AE_0^RG$ the class of all anti-$E_0$-ergodic equivalence relations.

**Proposition 9.3.** The set $AE_0^RG_E$ is closed in $S(E)$.

**Proof.** Miller [M, 2.1], has shown that $AE_0^RG_E$ is closed under taking unions of increasing sequences. It is obvious that it is also hereditary, so by Theorem 4.2 it is closed. \qed

**Theorem 9.4.** The set $E_0^RG_E$ is in the class $F_\sigma \cap G_\delta$ in $S(E)$.

**Proof.** Consider $S = S(E) \setminus E_0^RG_E$. Then clearly $E^RG_E \cap S = E^RG_E \cap AE_0^RG_E$. Moreover $S(E) \setminus E^RG_E \subseteq S$. Thus $S = (E^RG_E \cap AE_0^RG_E) \cup (S(E) \setminus E^RG_E)$, which is in $G_\delta \cup F_\sigma$ by Theorem 9.1 and Proposition 9.3. \qed

**Problem 9.5.** Are there $E$ for which Theorem 9.4 gives the optimal descriptive complexity of $E_0^RG_E$?
10 Richly ergodic equivalence relations

We first note that for any $E, S(E) \setminus \mathcal{ERG}_E$ is dense in $S(E)$. This is because any $F \in S(E)$ can be approximated by equivalence relations of the form $F|(X \setminus A) \sqcup id|A$, for Borel $A$ of small positive measure, which clearly are not ergodic.

We discuss here the following problem:

**Problem 10.1.** For which ergodic equivalence relations $E$ is the set $\mathcal{ERG}_E$ dense in $S(E)$?

Let us call an ergodic equivalence relation $E$ for which $\mathcal{ERG}_E$ is dense in $S(E)$ richly ergodic. We first show that there exist ergodic but not richly ergodic equivalence relations. These arise in the context of the so-called non-approximable equivalence relations, introduced in the forthcoming paper Gaboriau–Tucker-Drob [GT].

**Definition 10.2.** Let $E$ be a measure preserving countable Borel equivalence relation on $(X, \mu)$. We say that $E$ is non-approximable if whenever $E = \bigcup_n F_n$, where $F_n$ are Borel equivalence relations with $F_0 \subseteq F_1 \subseteq F_2 \ldots$, then there is $n$ and a positive measure Borel set $A$ with $E|A = F_n|A$.

It is an unpublished result of Gaboriau that if $a \in A(\Gamma, X, \mu)$, where $\Gamma$ is an infinite property (T) group, and $a$ is ergodic, then $E_a$ is non-approximable. This can be also seen as an application of [IKT, Corollary 5.4 and Corollary 2.15]. In [GT] the authors also show that if $a \in A(\Gamma \times \Delta, X, \mu)$ is a free action, where $\Gamma, \Delta$ are finitely generated, and $a|\Gamma$ is strongly ergodic while $a|\Delta$ is ergodic, then $E_a$ is non-approximable. We now have:

**Proposition 10.3.** If $E$ is ergodic and non-approximable, then $E$ is not richly ergodic.

**Proof.** First we show that $E$ is an isolated point in $\mathcal{ERG}_E$. Otherwise there is a sequence $F_n \in \mathcal{ERG}_E$ such that $F_n \to E$ and $F_n \neq E, \forall n$. By Theorem 4.1, we can write $E = \bigcup_m R_m$, with $R_0 \subseteq R_1 \subseteq \ldots$, and for each $m$, there is $n$ such that $R_m \subseteq F_n$. Since $E$ is non-approximable, there is $m, n$ and a positive measure Borel set $A$ such that $E|A = R_m|A \subseteq F_n|A \subseteq E|A$, so that $E|A = F_n|A$. Since $E$ is ergodic, $A$ is a complete section for $E$. Let $B = [A]_{F_n}$. Then we also have $E|B = F_n|B$. Since $B$ has positive measure, is $F_n$-invariant and $F_n$ is ergodic, $B = X$ (modulo null sets) and so $E = F_n$, a contradiction.
If now \( E \) was richly ergodic, it would follow that \( E \) is also an isolated point in \( S(E) \). However it is easy to see that \( S(E) \) is perfect, i.e., has no isolated points. This follows from the remarks in the first paragraph of this section.

We will next see that in some sense most \( E \) are richly ergodic (see the paragraph following Problem 5.10 here). If \( E_0 \subseteq E_1 \subseteq \ldots \) is an increasing sequence, we say that \( (E_n)_{n \in \mathbb{N}} \) is **strongly increasing** if for each \( n \) there is an ergodic \( T \in [\bigcup_n E_n] \) such that \( E_n \perp E_T \).

**Proposition 10.4.** If \( (E_n) \) is strongly increasing and \( E = \bigcup_n E_n \), then \( E \) is richly ergodic.

**Proof.** Let \( F \in S(E) \). Then \( F \cap E_n \to F \), so it is enough to show that for each \( n \), \( S(E_n) \) is contained in the closure of \( ERG_E \). Fix \( F \in S(E_n) \). Let then \( T \in [E] \) be ergodic with \( E_T \perp E_n \). By Dye’s Theorem, there is \( S \in [E_T] \), \( S \) mixing. Then also \( F \perp E_S \). Put \( F_n = F \lor E_S \cap E_n \in S(E) \). Then \( (F_n) \) is decreasing, \( \bigcap_n F_n = F \), so that \( F_n \to F \), and each \( F_n \) is ergodic.

**Proposition 10.5.** For any \( E \), there is \( E' \supseteq E \) which is richly ergodic.

**Proof.** Recall that for each equivalence relation \( R \), the set
\[
\{ T \in \text{Aut}(X,\mu) : E_T \perp R \}
\]
is comeager in the weak topology of \( \text{Aut}(X,\mu) \) (see Conley-Miller [CM]). Since the set of ergodic automorphisms in \( \text{Aut}(X,\mu) \) is also comeager, it follows that there is an ergodic \( T \) with \( R \perp E_T \).

Define now recursively \( E_0 \subseteq E_1 \subseteq \ldots \), by \( E_0 = E, E_{n+1} = E_n \lor E_{T_n} \), where \( E_{T_n} \perp E_n \) and \( T_n \) is ergodic. Then \( (E_n) \) is strongly increasing and thus \( E' = \bigcup_n E_n \) is richly ergodic.

**Proposition 10.6.** If \( E_0 \subseteq E_1 \subseteq \ldots \) are richly ergodic, so is \( E = \bigcup_n E_n \).

**Proof.** If \( F \in S(E) \), then \( F \cap E_n \to F \) and each \( F \cap E_n \) is the limit of ergodic equivalence relations contained in \( E_n \).

Thus the collection of richly ergodic equivalence relations is \( \omega \)-closed and cofinal in the class of all equivalence relations. We next discuss some classes of richly ergodic equivalence relations. Below let \( ERG \cap H = ERG \cap \mathcal{H} \) be the class of ergodic, hyperfinite equivalence relations.
Proposition 10.7. For any ergodic $E$, $\mathcal{ERGH}_E$ is dense in $\mathcal{H}_E$. In particular, every hyperfinite ergodic equivalence relation is richly ergodic.

Proof. It is enough to show that if $F \in S(E)$ is smooth, then $F$ is the limit of ergodic, hyperfinite equivalence relations in $S(E)$.

Let $Y$ be a Borel transversal for $F$. Then $E|Y$ is ergodic (on $Y$), so there is $S \in [E|Y]$ which is mixing. Let $F_n = F \vee E_{S^{2n}}$ (note that $E_{S^{2n}}$ is an equivalence relation on $Y$, which we can view as an equivalence relation on $X$ but extending it by equality outside $Y$). Then $(F_n)$ is decreasing and each $F_n$ is ergodic. Indeed, if a Borel set $A$ is $F_n$-invariant, then $A \cap Y$ is $E_{S^{2n}}$-invariant, so, since $E_{S^{2n}}$ is ergodic (on $Y$), we have that $\mu(A \cap Y) = 0$ or $\mu(Y \setminus A) = 0$, thus $\mu(A) = 0$ or $\mu(X \setminus A) = 0$, since $A = [A \cap Y]_F$ and similarly for $X \setminus A$. Moreover $Y$ is a complete section of $F_n$ and $F_n|Y = E_{S^{2n}}$ is hyperfinite, so $F_n$ is hyperfinite.

Finally we claim that $\bigcap_n F_n = F$, which completes the proof. Let $p: X \to Y$ be the Borel selector corresponding to $Y$, i.e., $p(x) \in Y$ and $xFp(x)$. Then if $(x,y) \in \bigcap_n F_n$, we have that for each $n$ there is a unique $k_n \in \mathbb{Z}$ with $p(y) = S^{k_n2^n}(p(x))$. Since $S$ is aperiodic, this can only happen if $p(x) = p(y)$, i.e., $xFy$.

Proposition 10.8. Let $\Gamma = \Gamma_1 * \Gamma_2 * \cdots$, where each countable group $\Gamma_n$ is non-trivial. Let $E$ be induced by a free, measure preserving, mixing action of $\Gamma$. Then $E$ is richly ergodic.

Proof. Let $\Delta_n = \Gamma_1 * \cdots * \Gamma_n$ and let $E_n$ be the equivalence relation induced by the restriction of the action to $\Delta_n$. Then $(E_n)$ is clearly increasing with $\bigcup_n E_n = E$ and we claim that $(E_n)$ is strongly increasing. This is because $\Gamma_{n+1} * \Gamma_{n+2}$ contains an element of infinite order, say $\delta$. If $T \in [E]$ corresponds to the action of $\delta$, then $T$ is ergodic and clearly $E_n \perp E_T$. So, by Proposition 10.4, $E$ is richly ergodic.

Finally we call an equivalence relation $E$ richly $E_0$-ergodic if $\mathcal{ERGH}_E$ is dense in $S(E)$.

Problem 10.9. Which $E_0$-ergodic equivalence relations $E$ are richly $E_0$-ergodic?

By Proposition 10.3 and the paragraph preceding it, it clearly follows that there are $E_0$-ergodic equivalence relations which are not richly $E_0$-ergodic.
There are also richly $E_0$-ergodic equivalence relations. One way to see this is by using a variation of the construction in Proposition 10.8.

Let $\Gamma = \mathbb{F}_\infty = \langle \gamma_0, \gamma_1, \ldots \rangle$. Let $a$ be the shift action of $\Gamma$ on $2^\Gamma$, equipped with the usual product measure. Then for any non-amenable $\Delta \leq \Gamma$, the restriction $a|\Delta$ of this action to $\Delta$ is $E_0$-ergodic (see, e.g., [HK, Theorem A4.1]). Let $E = E_a$, $\Gamma_n = \langle \gamma_0, \gamma_1, \ldots, \gamma_n \rangle$, $a_n = a|\Gamma_n$ and $E_n = E_{a_n}$. Then the $E_n$ are increasing and $E = \bigcup_n E_n$. We will check that $E$ is richly $E_0$-ergodic. For this it is enough to show that for each $n$ and $F \in S(E_n)$, $F$ is the limit of $E_0$-ergodic equivalence relations in $S(E)$.

Let $\Delta_m \leq \langle \gamma_{n+1}, \gamma_{n+2} \rangle$ be non-abelian subgroups with $\Delta_0 \supseteq \Delta_1 \ldots$ and $\bigcap_m \Delta_m = \{1\}$. Put $b_m = a|\Delta_m$ and $R_m = E_{b_m}$, so that $R_m$ is $E_0$-ergodic. Also clearly $R_m \perp F$. Let $F_m = F \lor R_m$. Then $F_m$ is $E_0$-ergodic, $F_0 \supseteq F_1 \ldots$ and $\bigcap_m F_m = F$, so $F_m \to F$. 

63
11 The cost function

For an equivalence relation $F$ denote by $C(F) = C_\mu(F)$ the cost of $F$. We will discuss here the complexity of the function $F \in S(E) \mapsto C(F) \in [0, \infty]$.

Let

$$\text{FinCost}_E = \{ F \in S(E) : C(F) < \infty \},$$

$$\text{InfCost}_E = \{ F \in S(E) : C(F) = \infty \}.$$

**Proposition 11.1.** The set FinCost$_E$ is dense in $S(E)$.

**Proof.** Let $F \in S(E)$ and fix $a \in A(F, E, \mu)$ with $F = E_a$. Let $F_n = E_{a|F_n}$. Then $F_n \to F$ and each $F_n$ has finite cost. \qed

We next have the following dichotomy:

**Theorem 11.2.** For any aperiodic equivalence relation $E$, exactly one of the following holds:

(i) For every $F \in S(E)$, $C(F) \leq 1$,

(ii) InfCost$_E$ is dense in the uniform topology of $S(E)$.

**Proof.** We will need the following lemma:

**Lemma 11.3.** Let $F$ be an equivalence relation with $C(F) > 1$. Then there is a subequivalence relation $F' \subseteq F$ with $C(F') = \infty$.

**Proof.** We use the ideas in the proof of [KM, Proposition 28.8]. Consider the ergodic decomposition $\pi : X \to \mathcal{EI}_F$, where $\mathcal{EI}_F$ is the standard Borel space of $F$-ergodic invariant probability measures on $X$ (we view here $F$ as a genuine countable Borel equivalence relation and not one defined $\mu$-a.e.); see Theorem 3.18. Let $\nu = \pi_*\mu$.

Put

$$Y_1 = \{ e \in \mathcal{EI}_F : C_e(F|X_e) > 1 \}, Y_0 = \mathcal{EI}_F \setminus Y_1,$$

where $X_e = \pi^{-1}\{e\}$. Then $Y_1$ is coanalytic and by [KM, Theorem 18.6] $\nu(Y_1) > 0$, so there is Borel $Z_1 \subseteq Y_1$ such that $\nu(Z_1) > 0$. Put $X_1 = \pi^{-1}(Z_1), X_0 = X \setminus X_1$. Then $X_1$ is Borel, $\mu(X_1) > 0$ and if $X_e \subseteq X_1$, then $C_e(F|X_e) > 1$. By the proof of [KM, Proposition 28.8], there is a free Borel action $a$ of $F_2$ on $X_1$ with $E_a \subseteq F|X_1$ and thus there is a free Borel action $a'$ of $F_\infty$ on $X_1$ with $E_{a'} \subseteq F|X_1$. Put $F' = E_{a'} \oplus F|X_0 \subseteq F$. Then $C(F') = C_{\mu|X_1}(E_{a'}) + C_{\mu|X_0}(F|X_0) = \infty$, since $C_{\mu|X_1}(E_{a'}) = \infty$. \qed
It is clear that (i) and (ii) are contradictory, so let us assume that (i) fails for $E$ and then show (ii). By Lemma 11.3, we can assume that there is $F \in S(E)$ with $C(F) = \infty$. It follows that $F$ is not smooth (see, e.g., [KM, Proposition 20.1]). Put $X_0 = \{x : [x]_E = \infty\}$, $X_1 = X \setminus X_0$. Thus $\mu(X_0) > 0$. Now $F|X_1$ is smooth and thus $C_{\mu|X_1}(F|X_1) < \infty$. Since

$$C(F) = C_{\mu|X_0}(F|X_0) + C_{\mu|X_1}(F|X_1) = \infty,$$

it follows that $C_{\mu|X_0}(F|X_0) = \infty$.

Fix now $\epsilon > 0$. Let $S \subseteq X_0$ be a complete section of $F|X_0$ such that $\mu(S) < \epsilon$. We have

$$C_{\mu|X_0}(F|X_0) = C_{\mu|S}(F|S) + \mu(X_0 \setminus S) = \infty,$$

so $C_{\mu|S}(F|S) = \infty$.

Let now $R \in S(E)$. Put $R_\epsilon = R|(X \setminus S) \oplus F|S$. Then

$$C(R_\epsilon) = C_{\mu|(X \setminus S)}(R|(X \setminus S)) + C_{\mu|S}(F|S) = \infty.$$

Also for any $T \in [E]$, we have

$$A_{T,R_\epsilon} = \{x : x \notin S \land T(x) \notin S \land x \in A_{T,R}\}$$

$$\cup \{x : (x \in S \lor T(x) \in S) \land x \in A_{T,R_\epsilon}\},$$

$$A_{T,R} = \{x : x \notin S \land T(x) \notin S \land x \in A_{T,R}\}$$

$$\cup \{x : (x \in S \lor T(x) \in S) \land x \in A_{T,R}\},$$

so $A_{T,R_\epsilon} \Delta A_{T,R} \subseteq S \cup T^{-1}(S)$ and therefore $\mu(A_{T,R_\epsilon} \Delta A_{T,R}) < 2\epsilon$. It follows that $R_\frac{\epsilon}{\pi}$ converges in the uniform topology to $R$. \hfill \Box

**Remark 11.4.** It is unknown if condition (i) in Theorem 11.2 is equivalent to hyperfiniteness.

The following problem is open. For convenience, we will say that $E$ is of **type II** if it is aperiodic and there is $F \in S(E)$ with $C(F) > 1$.

**Problem 11.5.** Let $E$ be a type II equivalence relation. Is $\text{InfCost}_E$ comeager in $S(E)$?

We will next consider the descriptive complexity of the cost function.
Proposition 11.6. The set \( \text{FinCost}_E \) is analytic in \( S(E) \) and the cost function \( F \mapsto C(F) \) is Borel on \( \text{FinCost}_E \).

Proof. The first assertion follows by a direct calculation (or using Proposition 18.1 and Proposition 18.11 below).

For the second assertion, we recall that if an ergodic \( F \in S(E) \) has finite cost, then it is induced by an action of some \( \mathbb{F}_n \) (see [KM, Lemma 27.7]). Also the cost function \( a \in A(\mathbb{F}_n, E) \mapsto C(a) = C(E_a) \) is upper semicontinuous on \( A(\mathbb{F}_n, E) \) by [K, First Remark in page 78]. Thus for ergodic \( F \in S(E) \) of finite cost and \( r \in \mathbb{R} \), we have:

\[
C(F) < r \iff \exists n \exists a \in A(\mathbb{F}_n, E)(E_a = F \& C(a) < r)
\]

\[
\iff \forall n \forall a \in A(\mathbb{F}_n, E)(E_a = F \implies C(a) < r),
\]

which shows that the cost function is Borel on the set \( \mathcal{ERG}_E \cap \text{FinCost}_E \). The general case follows by using the Ergodic Decomposition Theorem 3.18, Theorem 3.19 and the integration formula for cost with respect to the ergodic decomposition [KM, Corollary 18.6], which, in particular, shows that if an equivalence relation has finite cost, so do (almost) all its ergodic components.

The following is an open problem:

Problem 11.7. Is the cost function \( F \mapsto C(F) \) Borel on \( S(E) \)? Equivalently is the set \( \text{FinCost}_E \) Borel in \( S(E) \)?

We next notice some related facts and questions. It is clear from Theorem 11.2 that for each \( E \) of type II the sets \( \{ F \in S(E) : C(F) > r \}, \{ F \in S(E) : C(F) \geq r \} \), for \( r \in \mathbb{R}, r \geq 1 \), are not uniformly closed. We can also see that for some \( E \) the sets \( \{ F \in S(E) : C(F) < r \}, \{ F \in S(E) : C(F) \leq r \}, r \geq 1 \), are not closed. Take \( n > r \), let \( \Gamma = \mathbb{F}_n \times \mathbb{Z} \), let \( a \in \text{FR}(\Gamma, X, \mu) \) and let \( E_a \subseteq E \). Put \( \Gamma_m = 2^m \mathbb{Z}, m \geq 1 \), and let \( E_m = E_a|\mathbb{F}_n \times \Gamma_m \), so that \( E_1 \supseteq E_2 \ldots \) and \( C(E_m) = 1 \). Now \( \bigcap_m E_m = E_a|\mathbb{F}_n \), so \( E_m \to E_a|\mathbb{F}_n \) and \( C(E_a|\mathbb{F}_n) = n > r \). A similar argument, using \( \Gamma = \mathbb{F}_\infty \times \mathbb{Z} \), shows that in general \( \{ F \in S(E) : C(F) < \infty \} \) is not closed. The following problem is open:

Problem 11.8. Are the sets

\[
\{ F \in S(E) : C(F) < r \}, r > 1,
\]

\[
\{ F \in S(E) : C(F) < \infty \}
\]

\[
\{ F \in S(E) : C(F) \leq r \}, r \geq 1.
\]
uniformly closed?

One can also use these observations to answer a question that arises from [K, First Remark in page 78]. It is shown there that when the infinite group \( \Gamma \) is finitely generated, the cost function \( C \) on \( A(\Gamma, E) \) is upper semicontinuous. Is that true for arbitrary infinite \( \Gamma \)? The answer is negative:

**Proposition 11.9.** For any equivalence relation \( E \) of type II, the function \( a \in A(\mathbb{F}_\infty, E) \mapsto C(a) \) is not upper semicontinuous.

**Proof.** By Theorem 6.1, there is a continuous map \( \Psi: S(E) \to A(\mathbb{F}_\infty, E) \) such that \( E_{\Psi(F)} = F \). So if the cost function was upper semicontinuous in \( A(\mathbb{F}_\infty, E) \), for each \( r \in \mathbb{R} \) the set \( \{ F \in S(E) : C(F) \geq r \} \) would be closed in \( S(E) \), a contradiction. \( \square \)

Finally we show that an analog of Theorem 6.1 fails for \( \mathbb{F}_n, n \geq 2 \). Below let \( \mathcal{F}_{n,E} = \{ F \in S(E) : \exists a \in A(\mathbb{F}_n, E)(E_a = E) \} \).

**Proposition 11.10.** Let \( n \geq 2 \). If \( E \) is of type II, there is no continuous function \( \Psi_n: \mathcal{F}_{n,E} \to A(\mathbb{F}_n, E) \) such that \( E_{\Psi_n(F)} = F \).

**Proof.** As in the proof of Lemma 11.3, there is an invariant Borel set \( X_1 \) of positive measure and a free Borel action \( a_\infty \) of \( \mathbb{F}_\infty \) on \( X_1 \) with \( E_{a_\infty} \subseteq E \). Let for \( n \geq 1 \), \( a_n = a_{\infty}|\langle \gamma_0, \gamma_1, \ldots \rangle \), where \( \{ \gamma_0, \gamma_1, \ldots \} \) are free generators of \( \mathbb{F}_\infty \). Let \( X_0 = \bigcup\mathcal{T} \setminus X_1 \) and put \( R_0 = \text{id}|X_0 \) and \( F_n = E_{a_n} \oplus R_0 \). Then \( C(F_n) = 2\mu(X_1) \).

**Lemma 11.11.** Let \( a_0 = a_{\infty}|\langle \gamma_0 \rangle, F_0 = E_{a_0} \oplus R_0 \). Then \( F_n \to F_0 \).

**Proof.** Below put \( \delta \cdot x = a_{\infty}(\delta, x) \). Fix \( T \in [E] \). Then

\[
A_{T,F_n} = \{ x \in X_1 : T(x) \in \langle \gamma_0, \gamma_n \rangle \cdot x \} \sqcup \{ x \in X_0 : T(x) = x \},
\]

\[
A_{T,F_0} = \{ x \in X_1 : T(x) \in \langle \gamma_0 \rangle \cdot x \} \sqcup \{ x \in X_0 : T(x) = x \}.
\]

Thus \( A_{T,F_0} \subseteq A_{T,F_n} \) and \( (A_{T,F_n} \setminus A_{T,F_0}) \cap (A_{T,F_m} \setminus A_{T,F_0}) = \emptyset \), if \( n \neq m \), so \( \mu(A_{T,F_n} \setminus A_{T,F_0}) \to 0 \), thus \( \mu(A_{T,F_n}) \to \mu(A_{T,F_0}) \).

Note also that \( C(F_0) = \mu(X_1) \). If such \( \Psi_n \) existed, and since the cost function is upper semicontinuous on \( A(\mathbb{F}_n, E) \), the set \( \{ F \in S(E) : C(F) \geq r \} \) would be closed in \( \mathcal{F}_{n,E} \). Taking \( r = 2\mu(X_1) \) we have a contradiction. \( \square \)

Notice that the set \( \mathcal{F}_{n,E} \) is analytic in \( S(E) \). The following problem is open:
Problem 11.12. Let \( n \geq 2 \). Is there a Borel function \( \Psi_n : \mathcal{F}_{n,E} \to A(\mathbb{F}_n, E) \) such that \( E_{\Psi_n(F)} = F \)?

For \( n = 1 \), \( \mathcal{F}_{1,E} = \mathcal{H}_E \), thus, by Theorem 7.1, \( \mathcal{F}_{1,E} \) is closed in \( S(E) \) and we will see in Theorem 13.1 that Problem 11.12 has a positive solution for \( n = 1 \). (Note that \( A(\mathbb{F}_1, E) = A(\mathbb{Z}, E) \) is homeomorphic to \([E]\).) However we do not know if there is continuous \( \Psi_1 : \mathcal{F}_{1,E} \to A(\mathbb{Z}, E) \) with \( E_{\Psi_1(F)} = F \).
12 Normality

We discuss here normal subequivalence relations, see [FSZ]. Let $E$ be ergodic and let $N = [E : F] \leq \infty$ be the index of $F$ in $E$, i.e., the number of $F$-classes in each $E$-class. A sequence $(\varphi_n)_{n<N}$ of Borel functions on $X$ such that for each $x$, $([\varphi_n(x)]_F)_{n<N}$ is an injective enumeration of the $F$-classes in $[x]_E$ is called a choice sequence. Again we identify two such sequences if they agree a.e. Every $F$ admits a choice sequence and if $F$ is also ergodic, then such $(\varphi_n)_{n<N}$ can be found which are in $\text{Aut}(X, \mu)$ (see [FSZ, Lemma 1.3]).

**Definition 12.1.** Let $E$ be ergodic. A subequivalence relation $F \in S(E)$ is normal in $E$, in symbols

$$F \triangleleft E,$$

if there are choice sequences which are $F$-invariant.

In particular, if $F \triangleleft E$ and $F$ is ergodic, then one can find choice sequences which are $F$-invariant and in $\text{Aut}(X, \mu)$. We now have the following result concerning the complexity of the set of normal subequivalence relations.

**Theorem 12.2.** The set $\text{Normal}(E)$ of normal subequivalence relations of an ergodic equivalence relation $E$ is Borel in $S(E)$.

**Proof.** We first note the following fact:

**Lemma 12.3.** The set $\{F \in S(E) : [E : F] = N\}$ is $F_{\sigma \delta}$, for any $N \leq \infty$.

**Proof.** For $N = \infty$ this follows from Proposition 8.1. So we can assume that $N < \infty$. Then the proof is similar to that of Proposition 8.3. Let $(T_i)$ be a generating sequence for $E$. Then we have that $[F : E] \leq N$ iff

$$\forall k \exists M \forall n \left( \mu(\{x : \exists s \in M^N \forall j \leq n \exists k < N(T_j(x)FTS_{n(k)}(x))\}) \geq 1 - \frac{1}{k} \right).$$

\[ \square \]

So it is enough to show that for each $N \leq \infty$, the set $\{F \in S(E) : [E : F] = N \& F \triangleleft E\}$ is Borel.

We will first deal with ergodic normal subequivalence relations and then consider the general case.
Ergodic case. The set \( \{ F \in \mathcal{ERG}_E : [E : F] = N \ & F \triangleleft E \} \) is Borel in \( S(E) \).

We will view below \( E \) as a genuine countable Borel equivalence relation (and not one defined a.e.). Let then \( R \subseteq S(E) \times E \) be as in Proposition 3.17, so that for each \( F \in S(E) \), \( R_F = F^0 \) is a subequivalence relation of \( E \) which is a representative for \( F \) in \( S(E) \). Let \( \Gamma = \{ \gamma_n \} \) be a countable group acting in a Borel way on \( X \) generating \( E \). Then define inductively for each \( F \in S(E) \), \( n < N \), a Borel function \( \varphi^F_n : X \to X \) as follows:

\[
\varphi^F_0(x) = x
\]

\[
\varphi^F_n(x) = \gamma_k \cdot x,
\]

where \( k \) is least such that \( \gamma_k \cdot x \not\in [\varphi^F_i(x)]_{F^0}, \forall i < n \), if such exists; else \( \varphi^F_n(x) = x \). Clearly \( (\varphi^F_n)_{n<N} \) is a choice sequence for \( F \) (a.e.). Moreover the relation \( Q \subseteq S(E) \times \mathbb{N} \times X^2 \), given by:

\[
Q(F,n,x,y) \iff \varphi^F_n(x) = y
\]

is Borel.

Define now for each \( F \in S(E) \), a function \( \sigma_F : E \to S_N \), where \( S_N \) is the symmetric group on \( N \) elements, as follows:

\[
\sigma_F(x,y)(i) = j \iff \varphi^F_i(x)F^0 \varphi^F_j(y),
\]

provided that there are exactly \( N \) \( F^0 \)-classes in \( [x]_E = [y]_E \); else \( \sigma_F(x,y)(i) = i \). Then \( \sigma_F \) is a Borel cocycle from \( E \) into \( S_N \) and is the index cocycle of \( F \) corresponding to the choice sequence \( (\varphi^F_n)_{n<N} \) (a.e.) (see [FSZ, Lemma 1.2]).

From [FSZ, Definition 2.1 and Theorem 2.2], we have that \( F \triangleleft E \) iff \( \sigma_F|F \) is a coboundary, i.e., there is a function \( f \in L(X, \mu, S_N) \) such that for \( xFy \),

\[
\sigma_F(x,y) = f(y)f(x)^{-1}
\]

(a.e.). Here \( L(X, \mu, S_N) \) is the space of Borel functions from \( X \) to the Polish group \( S_N \), two functions being identified if they agree a.e. Then \( L(X, \mu, S_N) \) is a Polish group under pointwise multiplication and the topology of convergence in measure. Let also \( Z^1(F,S_N) \) be the Polish space of Borel cocycles from \( F \) to \( S_N \) (two such cocycles being identified if they agree a.e.), see [K, Section 24]. The Polish group \( L(X, \mu, S_N) \) acts continuously on \( Z^1(F,S_N) \) via \( f \cdot \alpha(x,y) = f(y)\alpha(x,y)f(x)^{-1} \). Denoting by \( 1 \) the trivial cocycle (that sends any \( (x,y) \in F \) to the identity element 1 of
$S_N$), we thus have that $\alpha$ is a coboundary iff it is in the orbit of $L(X, \mu, S_N)$.

The stabilizer of 1 in this action consists of all $f \in L(X, \mu, S_N)$, which are $F$-invariant and thus constant, if $F$ is ergodic. Thus for ergodic $F$ this stabilizer is equal to the group $S_N$ (identified with the group of constant functions from $X$ to $S_N$). Clearly $S_N$ is a closed subgroup of $L(X, \mu, S_N)$, so let $T$ be a Borel set that contains exactly one element in each left-coset of $S_N$ in $L(X, \mu, S_N)$. Then if $\alpha$ is a coboundary there is a unique $f \in T$ such that $f \cdot 1 = \alpha$. Define then $P \subseteq \{F \in \mathcal{ERG}_E : [E : F] = N\} \times L(X, \mu, S_N)$ by

$$P(F, f) \iff f \in T \& f \cdot 1 = \sigma_F|F.$$ 

Then by the preceding discussion the first projection map is an injective map from $P$ onto $\{F \in \mathcal{ERG}_E : [E : F] = N \& F \triangleleft E\}$. It thus suffices to show that $P$ is a Borel set or that

$$S(F, f) \iff f \cdot 1 = \sigma_F|F.$$ 

is Borel.

Recall that $L(X, \mu, S_N)$ admits the compatible complete metric

$$d(f, g) = \int D(f(x), g(x))d\mu(x),$$

where $D$ is the usual compatible metric for $S_N$ (which is bounded by 1).

**Lemma 12.4.** For $f \in L(X, \mu, S_N)$, let for $m, n < N$,

$$A_{f,m,n} = \{x : f(x)(m) = n\} \in \text{MALG}_\mu.$$

Then $f \in L(X, \mu, S_N) \rightarrow A_{f,m,n} \in \text{MALG}_\mu$ is Lipschitz (for the usual metric $\rho$ on $\text{MALG}_\mu$).

**Proof.** Let $\epsilon$ be such that

$$D(p, q) < \epsilon \implies p(m) = q(m).$$

Then we will show that

$$\rho(A_{f,m,n}, A_{g,m,n}) \leq \frac{d(f, g)}{\epsilon}.$$ 

71
Let $d(f, g) = a$. Then by Chebyshev's inequality
\[ \mu(\{x: D(f(x), g(x)) \geq \epsilon\}) \leq \frac{a}{\epsilon}. \]

Now
\[ A_{f,m,n} \Delta A_{g,m,n} \subseteq \{x: D(f(x), g(x)) \geq \epsilon\}, \]
so $\rho(A_{f,m,n}, A_{g,m,n}) \leq \frac{a}{\epsilon}$. \hfill \Box

Lemma 12.5. There is a Borel set $U \subseteq L(X, \mu, S_N) \times X \times N^2$ such that for each $f \in L(X, \mu, S_N), x \in X$, the section $U_{f,x}$ is the graph of a permutation $p_{f,x} \in S_N$ and the map $f^0: X \to S_N$ given by $f^0(x) = p_{f,x}$ is equal to $f$ a.e.

Proof. We can assume that $X = [0, 1]$ and $\mu$ is Lebesgue measure. Let $A^*_{f,m,n}$ be the set of density points of $A_{f,m,n}$. Then by Lemma 12.4, the relation $U^*(f, x, m, n) \iff x \in A^*_{f,m,n}$ is Borel. Finally let
\[ U(f, x, m, n) \iff (U^*_{f,x} \text{ is not the graph of an element of } S_N \text{ and } m = n) \]
or (it is such a graph and $U^*(f, x, m, n)$).
\hfill \Box

We have now that
\[ S(F, f) \iff \forall \forall^* x [xFT_i(x) \implies \sigma_{F}(x, T_i(x)) = f(T_i(x))f(x)^{-1}], \]
where $\forall^* x$ means “for almost all $x$.” So $S(F, f)$ is equivalent to
\[ \forall \forall m \forall^* x [xFT_i(x) \implies \varphi_m^F(x)F^\varphi_{f(T_i(x))}f(x)^{-1}(m)(T_i(x))] \]
and therefore to
\[ \forall \forall m \forall^* x \exists j, k (xFT_i(x) \implies \{\{\varphi_m^F(x) = T_j(x) \text{ & } \varphi_{f(T_i(x))}f(x)^{-1}(m)(T_i(x)) = T_k(x)\} & T_j(x)FT_k(x))\}]. \]
Let $B$ be the Borel set of $x$ satisfying the condition within $\{\ldots\}$ in the line above, so that finally
\[ S(F, f) \iff \forall \forall m \forall^* x \exists j, k [x \notin A_{T_i,F} \text{ or } (x \in B & x \in A_{T_j,T_k,F})], \]
and so $S(F, f)$ is equivalent to:
\[ \forall \forall m \forall n \exists M \mu(\{x: \exists j, k \leq M[x \notin A_{T_i,F} \text{ or } (x \in B & x \in A_{T_j,T_k,F})]\}) \geq 1 - \frac{1}{n}. \]
72
Since the maps $F \mapsto A_{T_i,F}, A_{T_j,T_k,F}$ from $S(E)$ to $\text{MALG}_\mu$ are continuous, this shows that $S$ is Borel and completes the proof in the ergodic case.

General case. The set $\{ F \in S(E) : [F : E] = N & F \pitchfork E \}$ is Borel in $S(E)$.

Repeating the argument as in the ergodic case, we note that the stabilizer of 1 is the closed subgroup $G_F$ of the $F$-invariant functions in $L(X,\mu,S_N)$. Again as in the previous argument, it is enough to find a Borel transversal $T_F$ for the cosets of $G_F$ in $L(X,\mu,S_N)$, so that relation

$$T(F,f) \iff f \in T_F$$

is Borel (as a subset of $S(E) \times L(X,\mu,S_N)$). Denote by $\mathcal{F}$ the Effros Borel space of the closed subgroups of $L(X,\mu,S_N)$. By the usual proof of the existence of a Borel transversal for the cosets of a closed subgroup of a Polish group, it is then enough to show that the map $F \in S(E) \mapsto G_F \in \mathcal{F}$ is Borel or equivalently that there is a Borel function $\delta : S(E) \to L(X,\mu,S_N)\mathbb{N}$ such that for each $F \in S(E)$ the sequence $\delta(F)$ is dense in $G_F$.

To see this consider the Ergodic Decomposition Theorem 3.18 and Theorem 3.19, whose notation we use below. Thus $\pi_F$ is an ergodic decomposition of $F^0$, mapping $X$ to $P(X)$, and has range the set $\mathcal{E}_{F^0}$.

Then $f \in L(X,\mu,S_N)$ is $F$-invariant iff it is of the form $g \circ \pi_F$ for a uniquely determined $g \in L(P(X),(\pi_F)_*(\mu),S_N)$. Thus the map $g \in L(P(X),(\pi_F)_*(\mu),S_N) \mapsto g \circ \pi_F \in L(X,\mu,S_N)$ is an isometric embedding, whose range is $G_F$.

Now pick a countable Boolean algebra $\mathcal{B}$ of Borel subsets of $P(X)$ which generates its Borel sets. Then for any probability Borel measure $\nu$ on $P(X)$, $\mathcal{B}$ is dense in the measure algebra $\text{MALG}_\nu$. Fix also a countable dense set $\Sigma = \{ \sigma_n \}$ in $S_N$. Then the Borel maps from $P(X)$ into $S_N$ that are constant in the pieces of a partition of $P(X)$ in $\mathcal{B}$ and take values in $\Sigma$ form a dense set in any $L(P(X),(\pi_F)_*(\mu),S_N)$. Enumerate these functions as $\{ g_0, g_1, \ldots \}$.

Finally define the function $\delta = (\delta_n)$ as follows:

$$\delta_n(F) = g_n \circ \pi_F.$$ 

It only remains to check that this is a Borel function and for that we verify that for any $n$, any (genuine) Borel function $h_0$ from $X$ to $S_N$ and any $\epsilon > 0$, the set of all $F \in S(E)$ for which
\[ d(\delta_n(F), h_0) = \int D(\delta_n(F)(x), h_0(x))dx < \epsilon \]

is Borel, which is clear as the function \((F, x) \mapsto D(g_n(\pi_F(x)), h_0(x))\) is Borel.

\[ \square \]
13 A selection theorem for hyperfiniteness

Recall that $\mathcal{H}$ is the class of hyperfinite equivalence relations. For each $E$, the set $\mathcal{H}_E$ is closed in $S(E)$ by Theorem 7.1. Also the set $\mathcal{ERGH}_E$ of ergodic hyperfinite subequivalence relations of $E$ is a $G_δ$ set in $S(E)$ by Theorems 7.1 and 9.1. Note that if $F$ is in $\mathcal{ERG}$, then $F$ is aperiodic.

We next prove the following selection result.

**Theorem 13.1.** There is a Borel function $\Theta: \mathcal{H}_E \to [E]$ such that for $F \in \mathcal{H}_E$, if $\Theta(F) = T$, then $F = E_T$ (i.e., $xTy \iff \exists n \in \mathbb{Z}(T^n(x) = y)$).

**Proof.** We will first show in detail that there is a Borel function $\Phi: \mathcal{ERGH}_E \to [E]$ such that for $F \in \mathcal{ERGH}_E$, if $\Phi(F) = T$, then $F = E_T$, i.e, we will first prove the theorem for the ergodic hyperfinite equivalence relations. Then we will indicate how this can be extended to all hyperfinite equivalence relations.

Let for $F \in S(E)$,

$$A(F) = \{ T \in [F] : T \text{ is aperiodic} \}.$$

Then for any aperiodic $F$, $A(F)$ is a closed non-empty subset of $[F]$ (and thus of $[E]$); see [K, 3.5]. We first prove the following:

**Lemma 13.2.** The following are equivalent:

(i) There is a Borel function $\Phi: \mathcal{ERGH}_E \to [E]$ such that if $\Phi(F) = T$, then $F = E_T$ (i.e., $xTy \iff \exists n \in \mathbb{Z}(T^n(x) = y)$).

(ii) The function $A|\mathcal{ERGH}_E$ from $\mathcal{ERGH}_E$ to $F^*(E)$ is Borel.

(iii) There is a Borel function $\Omega: \mathcal{ERGH}_E \to [E]$ such that $\Omega(F) \in A(F)$.

**Proof.** (ii) $\Rightarrow$ (i). We need the following:

**Sublemma 13.3.** Let $F \in \mathcal{ERGH}_E$. Then the generic element $T \in A(F)$ has the property that $E_T = F$.

**Proof.** Let $C = \{ T \in A(F) : E_T = F \}$. We show first that it is dense in $A(F)$. To see this, fix $T_0 \in A(F)$ with $E_{T_0} = F$. Then the orbit of $T_0$ under the conjugation action of $[F]$ on $A(F)$ is dense in $A(F)$, by [K], 3.4. Clearly every element $T$ of that orbit has $E_T = F$.

It remains to show that $C$ is $G_δ$ in $A(F)$. For that it is enough to show that the map $[E] \ni T \mapsto E_T \in S(E)$ is of Baire class 1. This will follow if we can show that for any $S \in [E]$ and $\alpha \in \mathbb{R}$, the set $\{ T \in [E] : \alpha < \mu(A_{S,E_T}) \}$ is open.
Now

\[ A_{S,E_T} = \{ x: (x, S(x)) \in E_T \} = \{ x: \exists n \in \mathbb{Z}(S(x) = T^n(x)) \} = \bigcup_{N \in \mathbb{N}} A_N^T, \]

where \( A_N^T = \{ x: \exists |n| \leq N(S(x) = T^n(x)) \}.\) Clearly \( A_0^T \subseteq A_1^T \subseteq \ldots,\) so

\[ \alpha < \mu(A_{S,E_T}) \iff \exists N(\mu(A_N^T) > \alpha), \]

thus it suffices to show that

\[ \{ T: \mu(A_N^T) > \alpha \} \]

is open in \([E].\) Fix \( T_1 \) such that \( \mu(A_{T_1}^N) > \alpha \) and let \( \delta = \mu(A_{T_1}^N) - \alpha > 0.\) Then let \( \epsilon > 0 \) be such that \( N(N + 1)\epsilon < \delta.\) We will show that if \( d_u(T, T_1) < \epsilon,\) then \( \mu(A_N^T) > \alpha.\)

If \( d_u(T, T_1) < \epsilon,\) then \( d_u(T^n, T_1^n) < |n|\epsilon, \) for any \( n \in \mathbb{Z}.\) Since

\[ \{ x: S(x) = T^n(x) \} \Delta \{ x: S(x) = T_1^n(x) \} \subseteq \{ x: T^n(x) \neq T_1^n(x) \}, \]

we have

\[ \mu(\{ x: S(x) = T^n(x) \} \Delta \{ x: S(x) = T_1^n(x) \}) < |n|\epsilon, \]

so

\[ \mu(\{ x: \exists |n| \leq N(S(x) = T^n(x)) \} \Delta \{ x: \exists |n| \leq N(S(x) = T_1^n(x)) \}) \]

\[ \leq \sum_{|n| \leq N} (|n|\epsilon) = N(N + 1)\epsilon < \delta, \]

therefore

\[ \mu(A_N^T) > \mu(A_{T_1}^N) - \delta = \alpha. \]

This concludes the proof of the Sublemma.
Consider now the relation $P \subseteq \mathcal{E} \mathcal{R} \mathcal{G} \mathcal{H}_E \times [E]$ given by

$$P(F,T) \iff T \in A(F) \& E_T = F.$$  

Clearly it is Borel and our goal is to find a Borel uniformizing function $\Phi$ for $P$. To each $F \in \mathcal{E} \mathcal{R} \mathcal{G} \mathcal{H}_E$ assign the $\sigma$-ideal $I_F$ on $[E]$ defined by

$$I_F = \{W \subseteq [E] : W \cap A(F) \text{ is meager in } A(F)\}.$$  

It is clear that for $F \in \mathcal{E} \mathcal{R} \mathcal{G} \mathcal{H}_E$, $P_F = \{T : P(F,T) \notin I_F\}$. Therefore by [K2, 18.6], it is enough to show that $F \mapsto I_F$ is Borel on Borel. So let $Z$ be a Polish space and $U \subseteq Z \times \mathcal{E} \mathcal{R} \mathcal{G} \mathcal{H}_E \times [E]$ be Borel in order to show that

$$\{(z,F) : U_{z,F} \text{ is meager in } A(F)\}$$  

is Borel. In fact, more generally, we will show that for any $W \subseteq [E]$, which is an open non-empty set in $[E]$, the set

$$M_{U,W} = \{(z,F) : A(F) \cap W \neq \emptyset \& U_{z,F} \text{ is not meager in } A(F) \cap W\}.$$  

is Borel. Note that if $\{W_n\}$ is a basis of nonempty open sets in $[E]$, then we have for Borel $U, U_n \subseteq Z \times \mathcal{E} \mathcal{R} \mathcal{G} \mathcal{H}_E \times [E]$:

$$M_{\bigcup_n U_n,W} = \bigcup_n M_{U_n,W}$$

and (letting $\sim U = (Z \times \mathcal{E} \mathcal{R} \mathcal{G} \mathcal{H}_E \times [E]) \setminus U$)

$$M_{\sim U,W} = [(Z \times \mathcal{E} \mathcal{R} \mathcal{G} \mathcal{H}_E) \setminus \bigcap \{M_{U_n,W_n} : W_n \subseteq W, W_n \cap A(F) \neq \emptyset\}]$$

$$\cap \{(z,F) \in Z \times \mathcal{E} \mathcal{R} \mathcal{G} \mathcal{H}_E : A(F) \cap W \neq \emptyset\},$$

thus, since $\{(z,F) : Z \times \mathcal{E} \mathcal{R} \mathcal{G} \mathcal{H}_E : A(F) \cap W \neq \emptyset\}$ is Borel by our hypothesis, it is enough to show that $M_{U,W}$ is Borel for each $U = U_1 \times U_2 \times U_3$, where $U_1$ is open in $Z$, $U_2$ is open in $\mathcal{E} \mathcal{R} \mathcal{G} \mathcal{H}_E$ and $U_3$ is open in $[E]$. But in that case

$$(z,F) \in M_{U,W} \iff z \in U_1 \& F \in U_2 \& A(F) \cap W \neq \emptyset \&$$

$$U_3 \text{ is not meager in } A(F) \cap W$$

$$\iff z \in U_1 \& F \in U_2 \& A(F) \cap W \neq \emptyset \&$$

$$A(F) \cap W \cap U_3 \neq \emptyset,$$
which again is Borel by hypothesis.

(i) ⇒ (iii): Obvious taking Ω = Φ.

(iii) ⇒ (ii): By [K, 3.4], the conjugacy class \{T \Omega(F) T^{-1}: T \in [F]\} is dense in A(F). So for W ⊆ [E] open,

\[ A(F) \cap W \neq \emptyset \iff \exists T \in [F] (T \Omega(F) T^{-1} \in W) \]

for any countable dense subset \( \mathcal{D} \subseteq [F] \). It is thus enough to show that there is a Borel function \( D: S(E) \to [E]^\mathbb{N} \) such that \( D(F) = (T_n)_{n \in \mathbb{N}} \), where \( \{T_n\}_{n \in \mathbb{N}} \) is dense in \([F]\). Since \( F \in S(E) \) is identified with \([F]\), a closed subset of \([E]\), this follows from [K2, 12.13].

This concludes the proof of the Lemma. \( \square \)

Thus to complete the proof of Theorem 13.1 in the ergodic case, it is enough to prove (iii) of the preceding lemma.

We now use Proposition 3.17, in which we recall that \( E \) is viewed as a genuine equivalence relation and not one viewed a.e., Combining this with the proof of [K, 3.5], we then have:

**Lemma 13.4.** There is a Borel set \( Q \subseteq \mathcal{E} \mathcal{R} \mathcal{G} \mathcal{H}_E \times E \) such that for any \( F \in \mathcal{E} \mathcal{R} \mathcal{G} \mathcal{H}_E, Q_F \subseteq F^0 \) and \( Q_F \) is the graph of a Borel automorphism \( T_F \) of \( X \) (thus \( E_{T_F} \subseteq F^0 \)) such that \( T_F \) restricted to the aperiodic part of \( F^0 \) (i.e., the set of all \( x \) with \([x]_F \) infinite) is also aperiodic.

In particular, if \( \langle T_F \rangle \) is the element of \([F^0] = [F]\) represented by \( T_F \), then \( \langle T_F \rangle \in A(F) \). We put \( \Omega(F) = (T_F) \) for \( F \in \mathcal{E} \mathcal{R} \mathcal{G} \mathcal{H}_E \). It remains to verify that \( \Omega: \mathcal{E} \mathcal{R} \mathcal{G} \mathcal{H}_E \to [E] \) is Borel.

Fix \( T_0 \in [E] \). It is enough to show that

\[ \{ F \in \mathcal{E} \mathcal{R} \mathcal{G} \mathcal{H}_E: d(T_F, T_0) < \epsilon \} \]

is Borel in \( S(E) \). Now for \( F \in \mathcal{E} \mathcal{R} \mathcal{G} \mathcal{H}_E, \)

\[ d_u(T_F, T_0) < \epsilon \iff \mu(\{ x: T_F(x) \neq T_0(x) \}) < \epsilon \]

\[ \iff \mu(\{ x: (x,T_0(x)) \notin Q_F \}) < \epsilon, \]

\[ \iff \mu(\{ x: (F,x,T_0(x)) \notin Q \}) < \epsilon, \]

which is clearly a Borel condition on \( F \).

This completes the proof of selection for the ergodic case.
The proof in the general case can proceed in two different ways. The first is by using the ergodic composition theorem, see Theorem 3.19. The second uses a result of Miri Segal in her (unpublished) Ph.D. Thesis. I would like to thank Ben Miller for bringing this to my attention. Segal’s result states that for each (genuine) countable Borel equivalence relation $F$, which is hyperfinite $\mu$-a.e., one can find in an effective Borel way a Borel automorphism that generates $F$ $\mu$-a.e. A proof is contained in [CM1, Theorem J.8] (see also the note “Miri Segal’s effective witness of measure-theoretic hyperfiniteness” by Anush Tserunyan in: www.math.uiuc.edu/~anush/. Combined with Proposition 3.17 this shows the following:

**Proposition 13.5.** There is a Borel set $P \subseteq \mathcal{H}_E \times E$ such that for any $F \in \mathcal{H}_E, P_F \subseteq F^\circ$ and $P_F$ is the graph of a Borel automorphism $T_F$ of $X$ such that $E_{T_F}$ is equal to $F$ in $S(E)$.

This together with the argument following Lemma 13.4 completes the proof of Theorem 13.1. \hfill \Box

Combining Proposition 7.3 with Theorem 13.1 and the proof of [DJK, Theorem 5.1], we also have the following result:

**Theorem 13.6.** There is a Borel function $H: \mathcal{H}_E \to S(E)^\mathbb{N}$ such that for $F \in \mathcal{H}_E$ we have that for each $n$, $H(F)_n \in \mathcal{B}\mathcal{F}_E$, $H(F)_n \subseteq H(F)_{n+1}$, and $F = \bigcup_n H(F)_n$. 

79
14 Invariant, random equivalence relations on groups

(A) For each infinite countable group $\Gamma$, denote by $Eq(\Gamma)$ the space of equivalence relations on $\Gamma$. This is a compact subspace of $2^{2^{\Gamma}}$. The group $\Gamma$ acts continuously by translation on $Eq(\Gamma)$: if $\gamma \in \Gamma, e \in Eq(\Gamma)$, then

$$(\delta, \epsilon) \in \gamma \cdot e \iff (\gamma^{-1} \delta, \gamma^{-1} \epsilon) \in e.$$ 

Let $\sigma$ be a Borel probability measure on $Eq(\Gamma)$. If $\sigma$ is invariant under the action of $\Gamma$, we say that $\sigma$ is a $(\Gamma\text{-})$invariant, random equivalence relation (IRE) on $\Gamma$. We denote by $IRE(\Gamma)$ the space of these measures.

Clearly $IRE(\Gamma)$ is a compact subspace of the space of all Borel probability measures on $Eq(\Gamma)$ (which is equipped, as usual, with the weak$^*$-topology, in which it is compact metrizable)

There is a canonical connection between subequivalence relations of the equivalence relation $E_a$ induced by an action $a \in A(\Gamma, X, \mu)$ and IRE on $\Gamma$, which is a special case of structurability of such equivalence relations. See [KM, 29.1], [K3, Section 2], and [T-D, Appendix A] for the particular case of equivalence relations.

Let $a \in A(\Gamma, X, \mu)$ and put $E = E_a$. Given $F \in S(E)$, define the map $e_F^a = e_F: X \to Eq(\Gamma)$ by

$$(\gamma, \delta) \in e_F(x) \iff (\gamma^{-1} \cdot x, \delta^{-1} \cdot x) \in F.$$ 

Then $e_F$ is a $\Gamma$-equivariant Borel function. Put

$$\sigma^a(F) = \sigma(F) = (e_F)_*\mu.$$ 

Thus $\sigma^a(F) \in IRE(\Gamma)$.

**Proposition 14.1.** The map $\sigma^a: S(E) \to IRE(\Gamma)$ is continuous.

**Proof.** Fix $\alpha_i, \beta_i, \gamma_j, \delta_j \in \Gamma, i \leq m, j \leq k$, and put

$$A_{\alpha, \beta, \gamma, \delta, F}^a = A_{\alpha, \beta, \gamma, \delta, F} = \bigcap_{i \leq m} A_{(\alpha_i^a)^{-1}, (\beta_i^a)^{-1}, F} \cap \bigcap_{j \leq k} (X \setminus A_{(\gamma_j^a)^{-1}, (\delta_j^a)^{-1}, F}),$$

where $A_{S,T,F}$, for $S, T \in [E]$, is defined in the proof of Proposition 3.28.
It is enough to prove that the map that sends \( F \in S(E) \) to the real number
\[
\sigma^a(F)(\{e \in \text{Eq}(\Gamma): \forall i \leq m(\alpha_i, \beta_i) \in e \& \forall j \leq k(\gamma_j, \delta_j) \notin e\})
\]
is continuous. But this number is equal to \( \mu(A_{\bar{a}, \bar{b}, \bar{\gamma}, \bar{\delta}, F}) \), which depends continuously on \( F \), since, by Proposition 3.28, the map \( F \mapsto A_{S,T,F} \) as above is continuous.

**Remark 14.2.** The map \( \sigma^a \) is not injective. Consider, for example, the shift action \( s \) of \( \Gamma \) on \([0,1]^\Gamma \), with the usual product measure. Let \( F_1 = E_s \cap \{(x,y): x(1) = y(1)\} \), \( F_2 = E_s \cap \{(x,y): x(\gamma) = y(\gamma)\} \), where \( \gamma \neq 1 \). Then \( e_{F_1} = e_{F_2} \) is the constant function with value the equality relation \( =_\Gamma \) but \( F_1 \neq F_2 \).

It turns out that every IRE is generated by the above procedure for some, in fact free, action \( a \) and equivalence relation \( F \). Below we denote by \( \text{FR}(\Gamma, X, \mu) \) the set of free actions in \( A(\Gamma, X, \mu) \).

**Proposition 14.3.** \( \text{IRE}(\Gamma) = \{\sigma^a(F): a \in A(\Gamma, X, \mu), F \in S(E_a)\} = \{\sigma^a(F): a \in \text{FR}(\Gamma, X, \mu), F \in S(E_a)\} \).

**Proof.** Let \( \sigma \in \text{IRE}(\Gamma) \). Let \( b \in \text{FR}(\Gamma, Y, \nu) \) and put \( X = \text{Eq}(\Gamma) \times Y, \mu = \sigma \times \nu \). Let also \( a \) be the product action of \( \Gamma \) on \( X \), so that \( a \in \text{FR}(\Gamma, X, \mu) \). Define \( F \subseteq E_a \) by
\[
(e, x)F(f, y) \iff \exists \gamma (\gamma \cdot (e, x) = (f, y) \& (1, \gamma^{-1}) \in e).
\]
Then \( e_{F_a}^F(e, x) = e \) and so \( \sigma^a(F) = \sigma \). \( \square \)

A special case of the above construction of IRE is the following. Let \( Y \) be a standard Borel space and \( F \) a Borel equivalence relation on \( Y \). Consider the product space \( X = Y^{\Gamma} \) with the shift action \( s_Y \) of \( \Gamma \) on this space and let \( \mu \) be a shift-invariant probability measure on \( X \). Define the equivalence relation \( \bar{F} \) on \( X \) by \( x\bar{F}y \iff xE_{s_Y}y \& x(1)Fy(1) \). Let \( e_{\bar{F}}: X \rightarrow \text{Eq}(\Gamma) \) be the associated map, so that \( (\gamma, \delta) \in e_{\bar{F}}(x) \iff x(\gamma)Fx(\delta) \). Finally consider the IRE \( \sigma^{sx}(\bar{F}) \).

**Problem 14.4.** Is every element of \( \text{IRE}(\Gamma) \) of the form \( \sigma^{sx}(\bar{F}) \), for some measure \( \mu \) and Borel equivalence relation \( F \) on \( Y \)? What if we take \( F \) to be the equality relation on \( Y \)?
Another way to obtain IRE is the following. Let \( Sg(\Gamma) \) be the space of subgroups of \( \Gamma \), which is a compact subspace of \( 2^\Gamma \) on which \( \Gamma \) acts continuously by conjugation. An invariant, random subgroup (IRS) of \( \Gamma \) is a conjugation invariant Borel probability measure on \( Sg(\Gamma) \). Denote the space of such measures by \( IRS(\Gamma) \). There is a canonical homeomorphism \( \Sigma \) from \( Sg(\Gamma) \) into \( Eq(\Gamma) \) given by \((\gamma, \delta) \in \Sigma(H) \iff \gamma \delta^{-1} \in H\). Thus the equivalence classes of \( \Sigma(H) \) are the right cosets of \( H \). The range of \( \Sigma \) consists of the equivalence relations induced by the cosets of a subgroup of \( \Gamma \). The embedding \( \Sigma \) is also \( \Gamma \)-equivariant, thus if \( \mu \in IRS(\Gamma) \), then \( \Sigma_* \mu \in IRE(\Gamma) \) and the range of \( \Sigma_* \) consists of the IRE that concentrate on the range of \( \Sigma \). This forms a proper compact subset of \( IRE(\Gamma) \). Tucker-Drob [T-D, Appendix A] characterizes \( \Sigma_* IRS(\Gamma) \) as consisting of exactly those \( \sigma^a(F) \) for \( F \subseteq E_a \) that are normalized by \( a \), which means that each \( \gamma^a \) is an automorphism of \( F \), i.e., \( xFy \iff \gamma^a(x)F\gamma^a(y) \).

(B) We say that \( \sigma \in RS(\Gamma) \) is an aperiodic IRE if it concentrates on the equivalence relations all of whose classes are infinite. It is an infinite index IRE if it concentrates on the equivalence relations that have infinitely many classes. Both the aperiodic and the infinite index IRE form \( G_\delta \) sets in \( IRE(\Gamma) \). Similarly \( \sigma \) is a finite index IRE if it concentrates on the equivalence relations that have only finitely many classes. Finally, \( \sigma \) is a finite IRE if it concentrates on the equivalence relations all of whose classes are finite.

We now have the following results:

**Theorem 14.5.** Let \( \Gamma \) be an infinite countable group. The generic IRE on \( \Gamma \) is aperiodic and has infinite index.

*Proof.* By Propositions 14.1 and 14.3 and Theorem 7.2 the aperiodic IRE are dense in \( IRE(\Gamma) \) and by Proposition 8.1 the same is true for the infinite index IRE. \( \square \)

**Theorem 14.6.** Let \( \Gamma \) be an infinite amenable countable group. Then the finite index IRE are dense in \( IRE(\Gamma) \).

*Proof.* This follows as before from Proposition 8.3. \( \square \)

As in Problem 8.5, we do not know if this holds for all infinite \( \Gamma \).

**Theorem 14.7.** Let \( \Gamma \) be an infinite countable group. Then the following are equivalent:

82
(i) $\Gamma$ is amenable.

(ii) The finite IRE are dense in $\text{IRE}(\Gamma)$.

(iii) The Dirac measure $\delta_{\Gamma \times \Gamma}$ on the equivalence relation $\Gamma \times \Gamma$ is a limit of finite IRE.

Proof. (i) $\implies$ (ii) follows from Propositions 14.1 and 14.3 and the paragraph following Theorem 7.1, while (ii) $\implies$ (iii) is obvious.

(iii) $\implies$ (i): Let $\sigma_n$ be finite IRE such that $\sigma_n \to \delta_{\Gamma \times \Gamma}$. We will use these to find a left-invariant probability measure on $\Gamma$.

For $A \subseteq \Gamma$ and an equivalence relation $e$ with finite classes, put

$$\rho_e(A) = \frac{|A \cap [1]_e|}{|[1]_e|}. $$

Then, for each $n$, put

$$\rho_n(A) = \int \rho_e(A) d\sigma_n(e).$$

Clearly $\rho_n$ is a finitely additive probability measure on $\Gamma$.

Let now $\mathcal{U}$ be a non-principal ultrafilter on $\mathbb{N}$ and put

$$\rho(A) = \lim_{n \to \mathcal{U}} \rho_n(A).$$

Again $\rho$ is a finitely additive probability measure on $\Gamma$. We will show that it is left-invariant. We have for each $A \subseteq \Gamma$, $\gamma \in \Gamma$,

$$\rho(A) = \lim_{n \to \mathcal{U}} \int \rho_e(A) d\sigma_n(e),$$

and

$$\rho(\gamma A) = \lim_{n \to \mathcal{U}} \int \rho_e(\gamma A \cap [1]_e) d\sigma_n(e)$$

Now note that

$$\frac{|\gamma A \cap [1]_e|}{|[1]_e|} = \frac{|A \cap [\gamma^{-1}]_{\gamma^{-1}e}|}{|[\gamma^{-1}]_{\gamma^{-1}e}|},$$

so, using the invariance of $\nu_n$, we have

$$\rho(\gamma A) = \lim_{n \to \mathcal{U}} \int \rho_e(\gamma A) d\sigma_n(e).$$
It is thus enough to show that
\[ \lim_{n \to \infty} \int \left( \frac{|A \cap [1]|_e}{|[1]|_e} - \frac{|A \cap [\gamma^{-1}]|_e}{|[\gamma^{-1}]|_e} \right) d\sigma_n(e) = 0. \]

Since \( \sigma_n \to \delta_{\Gamma \times \Gamma} \), we have
\( \sigma_n(\{e: (1, \gamma^{-1}) \in e\}) \to \delta_{\Gamma \times \Gamma}(\{e: (1, \gamma^{-1}) \in e\}) = 1 \)
so, given \( \epsilon > 0 \), let \( N \) be large enough so that for \( n \geq N \),
\[ \sigma_n(\{e: [1]_e \neq [\gamma^{-1}]_e\}) < \epsilon. \]
Then
\[ \left| \int \left( \frac{|A \cap [1]|_e}{|[1]|_e} - \frac{|A \cap [\gamma^{-1}]|_e}{|[\gamma^{-1}]|_e} \right) d\sigma_n(e) \right| \leq \epsilon, \]
and the proof is complete. \( \square \)

(C) The space \( \text{IRE}(\Gamma) \) is a Choquet simplex (being the space of invariant Borel probability measures for a continuous action of \( \Gamma \) on a compact metrizable space). Its extremal points are the ergodic IRE, whose set we denote by \( \text{ERGIRE}(\Gamma) \). We next consider the question of whether \( \text{IRE}(\Gamma) \) is a Bauer simplex, i.e., \( \text{ERGIRE}(\Gamma) \) is closed in \( \text{IRE}(\Gamma) \), or the Poulsen simplex, i.e., \( \text{ERGIRE}(\Gamma) \) is dense in \( \text{IRE}(\Gamma) \). By the results in Glasner-Weiss [GW], if \( \Gamma \) has property (T), then \( \text{IRE}(\Gamma) \) is a Bauer simplex. However the following is open:

**Problem 14.8.** Assume that the countable group \( \Gamma \) does not have property (T). Is \( \text{IRE}(\Gamma) \) the Poulsen simplex?

(D) One can use ideas similar to those in this section to provide one more description of the topology of \( S(E) \).

Fix \( a \in A(\Gamma, X, \mu) \) with \( E = E_a \). Consider the compact metrizable space \( \mathcal{P}(\Gamma)^\mathbb{N} \times \text{Eq}(\Gamma) \) (where \( \mathcal{P}(\Gamma) \) is the space of all subsets of \( \Gamma \), identified with \( 2^\Gamma \)), on which \( \Gamma \) acts continuously by \( \gamma \cdot ((a_n), e) = ((\gamma a_n), \gamma \cdot e) \). Fix also a sequence \( (D_n) \) which is dense in \( \text{MALG}_\mu \). Define then the map
\[ \theta_F^a = \theta_F : X \to \mathcal{P}(\Gamma)^\mathbb{N} \times \text{Eq}(\Gamma), \]
by \( \theta_F(x) = ((a_n), e) \), where \( a_n = \{ \gamma: \gamma^{-1} \cdot x \in D_n \} \) and \( e = e_F(x) \). Let \( \tau^n(F) = \tau(F) = (\theta_F)_* \mu \in \text{IRE}(\Gamma) \).
Proposition 14.9. The map $\tau^a : S(E) \to \text{IRE}(\Gamma)$ is a homeomorphism into $\text{IRE}(\Gamma)$.

Proof. The continuity of $\tau^a$ is proved as in Proposition 14.1. That $\tau^a$ is injective follows from the paragraph preceding Proposition 3.13 and Lemma 3.9. That $(\tau^a)^{-1}$ is continuous can be deduced from the paragraph following Proposition 3.13.

Thus we can also view $S(E)$ as a $G_\delta$ subset of $\mathcal{P}(\Gamma)^N \times \text{Eq}(\Gamma)$.

(D) Recall that for $a, b \in A(\Gamma, X, \mu)$, we let $a \prec b$ iff $a$ is weakly contained in $b$ (see [K]). Concerning the map $\sigma^a(F)$ that sends $F \in S(E_a), a \in A(\Gamma, X, \mu)$, to an IRE on $\Gamma$, we consider its “slice” corresponding to the $\prec$-predecessors of an action $b$.

Theorem 14.10. Let $\Gamma$ be an infinite countable group and $b \in A(\Gamma, X, \mu)$. Then the set

$$\{ \sigma^a(F) : a \in A(\Gamma, X, \mu), a \prec b, F \in S(E_a) \}$$

is a compact subset of $\text{IRE}(\Gamma)$.

Proof. We use the method of ultraproducts.

Fix a non-principal ultrafilter $\mathcal{U}$ on $\mathbb{N}$. Let $a_n \in A(\Gamma, X, \mu), a_n \prec b$ and $F_n \in S(E_{a_n})$, for $n \in \mathbb{N}$. As in the proof of Proposition 14.1, for each action $d \in A(\Gamma, Z, \rho), F \in S(E_d)$, and $\alpha_i, \beta_i, \gamma_j, \delta_j \in \Gamma, i \leq m, j \leq k$, we put

$$A^d_{\alpha, \beta, \gamma, \delta, F} = \bigcap_{i \leq m} A^d_{\alpha^i, (\beta^i)^{-1}, F} \cap \bigcap_{j \leq k} (X \setminus A^d_{\gamma^j, (\delta^j)^{-1}, F}),$$

where for each $S, T \in [E_d], A^d_{S, T, F} = \{ z \in Z : (S(z), T(z)) \in F \}$. In particular, $A^d_{T, F} = \{ z : (z, T(z)) \in F \} = A^d_{\text{id}, T, F}$ and $A^d_{S, T, F} = S^{-1}(A^d_{T, F})$.

We will show that there is a standard probability space $(Y, \nu)$, an action $c \in A(\Gamma, Y, \nu), c \prec b$, and an equivalence relation $F \in S(E_c)$ on $(Y, \nu)$ such that

$$\nu(A^c_{\alpha, \beta, \gamma, \delta, F}) = \lim_{n \to \mathcal{U}} \mu(A^{a_n}_{\alpha, \beta, \gamma, \delta, F_n}),$$

for all $\alpha_i, \beta_i, \gamma_j, \delta_j \in \Gamma, i \leq m, j \leq k$, which implies that $\{ \sigma^a(F) : a \in A(\Gamma, X, \mu), a \prec b, F \in S(E_a) \}$ is compact in $\text{IRE}(\Gamma)$. 85
We will use below the notation and terminology of Conley–Kechris–Tucker-Drob [CKT] concerning ultraproducts. Let \((X_\mathcal{U}, \mu_\mathcal{U})\) be the ultrapower of \((X, \mu)\) and let \(a = \prod_n a_n / \mathcal{U}\) the ultraproduct of \((a_n)\). Put for \(g \in \Gamma\),

\[
A_{a_n,F_n}^g = \{ x \in X : (x, g^a_n(x)) \in F_n \}.
\]

Then for each \(n\), \((A_{a_n,F_n}^g)\) satisfies conditions 1.-4. of Proposition 3.11. So if \(A_g = [(A_{a_n,F_n}^g)]_\mathcal{U}\) is the ultrapower of \((A_{a_n,F_n}^g)\), it follows that \((A_g)_{g \in \Gamma}\) also satisfies these conditions (all of course \(\mu_\mathcal{U}\)-a.e).

If \(B_\mathcal{U}\) is the \(\sigma\)-algebra on which \(\mu_\mathcal{U}\) lives, let \(\text{MALG}_{\mu_\mathcal{U}}\) be the measure algebra of \((X_\mathcal{U}, B_\mathcal{U}, \mu_\mathcal{U})\). By the proof of Proposition 4.3 in [CKT], there is a map \(T_\mathcal{U}: \Gamma \times \text{MALG}_{\mu_\mathcal{U}} \to \text{MALG}_{\mu_\mathcal{U}}\) such that if \(g \in \Gamma, A \in \text{MALG}_{\mu_\mathcal{U}} \setminus \{\emptyset\}\) and \(g^a(x) \neq x, \forall x \in A\), then \(T_\mathcal{U}(g, A) \subseteq A, \mu_\mathcal{U}(T_\mathcal{U}(g, A)) \geq \frac{1}{16} \mu_\mathcal{U}(A)\) and \(g^a \cdot T_\mathcal{U}(g, A) \cap T_\mathcal{U}(g, A) = \emptyset\).

As in [CKT, Sections 4.2, 4.3], fix a countable Boolean subalgebra \(B_0 \subseteq \text{MALG}_{\mu_\mathcal{U}}\) which contains all \(A_g, \text{Fix}(g^a), g \in \Gamma\), and is closed under the action \(a\), the function \(S_\mathcal{U}\) in [CKT, Section 3.2] and the function \(T_\mathcal{U}\) as above. Let \(B = \sigma(B_0) \subseteq \text{MALG}_{\mu_\mathcal{U}}\) be the \(\sigma\)-algebra generated by \(B_0\). This is a countably generated, non-atomic, \(a\)-invariant subalgebra of \(\text{MALG}_{\mu_\mathcal{U}}\), so there is a standard probability space \((Y, \nu)\) and a measurable map \(\pi: X_\mathcal{U} \to Y\) with \(\pi_* \mu_\mathcal{U} = \nu\) and an action \(c \in A(\Gamma, Y, \nu)\) such that \(\pi(g^a(x)) = g^c(\pi(x)), g \in \Gamma, x \in X_\mathcal{U}\) (i.e., \(c\) is a factor of \(a\)) and \(B \mapsto \pi^{-1}(B)\) is an isomorphism of \((\text{MALG}_\nu, \nu)\) with \((B, \mu_\mathcal{U}, B)\) preserving the \(\Gamma\)-action.

Let then \(B_g, g \in \Gamma, \text{in MALG}_\nu\), be such that \(\pi^{-1}(B_g) = A_g\). Then \(\nu(B_g) = \mu_\mathcal{U}(A_g)\) and the family \((B_g)_{g \in \Gamma}\) satisfies 1.-3. of Lemma 3.11. We will next verify that condition 4. of the same proposition also holds. Assuming this, there will be an equivalence relation \(F\) on \((Y, \nu)\) with \(A_{c,F}^g = B_g\). Replacing \(F\) by \(F \cap E_c\), we can assume that \(F \subseteq E_c\). Then, for each \(\alpha_i, \beta_i, \gamma_j, \delta_j \in \Gamma, i \leq m, j \leq k\),

\[
\nu(A_{\alpha_i,\beta_i,\gamma_j,\delta_j,F}^c) = \lim_{n \to \mathcal{U}} \mu(A_{\alpha_i,\beta_i,\gamma_j,\delta_j,F_n}^a).
\]

Since \(c\) is a factor of an ultraproduct of \((a_n)\) and \(a_n \prec b\), for each \(n\), then \(c \prec b\) (see [CKT, Theorem 1]) and the proof is complete.

In order to verify condition 4. in Lemma 3.11, it is enough to show that for each \(g \in \Gamma,\)

\[
\pi^{-1}(\text{Fix}(g^c)) = \text{Fix}(g^a).
\]

It is clear that \(\pi^{-1}(\text{Fix}(g^c)) \supseteq \text{Fix}(g^a)\). If they are distinct (in \(\text{MALG}_{\mu_\mathcal{U}}\), let \(A = \pi^{-1}(\text{Fix}(g^c)) \setminus \text{Fix}(g^a) \in B\) and let \(\mu_\mathcal{U}(A) = \epsilon > 0\). Then \(g^a(x) \neq x, \forall x \in \text{Fix}(g^c) \setminus \text{Fix}(g^a)\), for each \(a \in A\), \(\pi^{-1}(\text{Fix}(g^a)) \cap \text{Fix}(g^c) = \emptyset\), so

\[
\pi^{-1}(\text{Fix}(g^c)) \cap \text{Fix}(g^a) = \emptyset.
\]

Therefore

\[
\pi^{-1}(\text{Fix}(g^c)) = \text{Fix}(g^a).
\]
A. Let $B \in B_0$ be such that $\mu_U(B \triangle A) < \frac{\varepsilon}{32}$. Since $A \subseteq X_U \setminus \text{Fix}(g^a) \in B_0$, we can assume (by replacing $B$ by $B \setminus \text{Fix}(g^a)$) that $B \cap \text{Fix}(g^a) = \emptyset$. Since $B_0$ is closed under $T_U$, let $C \subseteq B, C \in B_0$ be such that $g^a \cdot C \cap C = \emptyset$ and $\mu_U(C) \geq \frac{1}{16} \mu_U(B)$. In particular $C \cap A \neq \emptyset$. Since $C \cap A \in B$, let $D \in \text{MALG}_\nu$ be such that $\pi^{-1}(D) = C \cap A \subseteq \pi^{-1}(\text{Fix}(g^a))$, so $\emptyset \neq D \subseteq \text{Fix}(g^c)$. On the other hand, $\pi^{-1}(g^c \cdot D) = g^a \cdot (C \cap A)$, so $\pi^{-1}(g^c \cdot D) \cap \pi^{-1}(D) = g^a \cdot (C \cap A) \cap (C \cap A) = \emptyset$, so $g^c \cdot D \cap D = \emptyset$, while $g^c \cdot D = D$, a contradiction.  

**Corollary 14.11.** Let $\Gamma$ be an infinite countable group and assume that $b \in A(\Gamma, X, \mu)$ is ergodic but not strongly ergodic. Then the set

$$\{ \sigma^a(F) : a \in A(\Gamma, X, \mu), a \prec b, F \in S(E_a) \}$$

is a compact convex subset of $\text{IRE}(\Gamma)$.

**Proof.** By [AW, Theorem 3] the set $\{ a \in A(\Gamma, X, \mu) : a \prec b \}$ is closed under convex combinations (see [K, Section 10, (F)] for the concept of convex combinations of actions).  

87
15 Ultraproducts of equivalence relations

We will use here the notation of Section 14 and [CKT]. Consider the space $(X, \mu)$ and for each non-principal ultrafilter $\mathcal{U}$ on $\mathbb{N}$ form the ultrapower $X_\mathcal{U}$ with the associated measure $\mu_\mathcal{U}$. For $(x_n) \in X^\mathbb{N}$, put $[x_n]_\mathcal{U} = [(x_n)]_\mathcal{U} \in X_\mathcal{U}$. We will use below the following general fact, where for Borel $A \subseteq X$, we put $[A]_\mathcal{U} = \{[x_n]_\mathcal{U} \in X_\mathcal{U} : \mathcal{U}(x_n \in A) \subseteq X_\mathcal{U}\}$.

**Proposition 15.1.** $[\bigcup_{i \in \mathbb{N}} A_i]_\mathcal{U} = \bigcup_{i \in \mathbb{N}} [A_i]_\mathcal{U}$ in $\mathrm{MALG}_{\mu_\mathcal{U}}$.

*Proof.* Let $B_j = \bigcup_{i \leq j} A_i$. Then $[B_j]_\mathcal{U} = \bigcup_{i \leq j} [A_i]_\mathcal{U}$ and $\bigcup_j B_j = \bigcup_i A_i$; $\bigcup_j [B_j]_\mathcal{U} = \bigcup_i [A_i]_\mathcal{U}$, so we can assume that $A_0 \subseteq A_1 \subseteq \ldots$, and thus $[A_0]_\mathcal{U} \subseteq [A_1]_\mathcal{U} \subseteq \ldots \subseteq [\bigcup_i A_i]_\mathcal{U}$. Let $\mu_\mathcal{U}([\bigcup_i A_i]_\mathcal{U}) = t$. It is enough to show that $\mu_\mathcal{U}([\bigcup_i A_i]_\mathcal{U}) = t$. Now $t = \mu([\bigcup_i A_i]_\mathcal{U}) = \lim_{i \to \infty} \mu(A_i)$ and thus $\mu([\bigcup_i A_i]_\mathcal{U}) = \lim_{i \to \infty} \mu([A_i]_\mathcal{U}) = t$. □

Consider now a sequence of measure preserving countable Borel equivalence relations $(F_n)$ on $(X, \mu)$. Let $E \in \mathcal{E}$ be such that $F_n \subseteq E$, for each $n$. Fix an action $a \in A(\Gamma, X, \mu)$ such that $E_a = E$. We will use this to define an ultrapower $\prod_n^a F_n/\mathcal{U}$ of the $F_n$. We will then show that it is independent of $E$ and the action $a$, so that we can define unambiguously the ultraprodut $\prod_n F_n/\mathcal{U}$.

As in the proof of Theorem 14.10, we let $A_{g,F_n}^a = \{x \in X : (x, g^a(x)) \in F_n\}$ and $A_g^a = [(A_{g,F_n}^a)]_{\mathcal{U}}$. Consider also the ultrapower $a_{\mathcal{U}} = \prod_n^a a_{\mathcal{U}}$. Then $(A_g^a)$ satisfies conditions 1.-4. of Lemma 3.11 and therefore it gives rise to a countable equivalence relation $F^a = \prod_n^a F_n/\mathcal{U}$ on $X_\mathcal{U}$ defined by

$$[x_n]_\mathcal{U} F^a[y_n]_\mathcal{U} \iff \exists g \in \Gamma (g^a([x_n]_\mathcal{U}) = [y_n]_\mathcal{U} \& [x_n]_\mathcal{U} \in A_g^a).$$

Thus $\prod_n^a F_n/\mathcal{U}$ is the union of the graphs of $g^a|A_g^a, g \in \Gamma$. It is easy to see that the equivalence relation induced by each $g^a|A_g^a$ is also induced by a single measure preserving automorphism of $(X_\mathcal{U}, \mu_\mathcal{U})$ and thus $\prod_n^a F_n/\mathcal{U}$ is induced by a measure preserving action of a countable group on $(X_\mathcal{U}, \mu_\mathcal{U})$. Thus we can view $\prod_n^a F_n/\mathcal{U}$ as a countable, measure preserving equivalence relation on $(X_\mathcal{U}, \mu_\mathcal{U})$. Note that we also have $A_{g,F_n}^a = [(A_{g,F_n}^a)]_{\mathcal{U}}$ and so $\mu_\mathcal{U}(A_{g,F_n}^a) = \lim_{n \to \mathcal{U}} \mu(A_{g,F_n}^a)$.

We now check that this construction is independent of $E, a$. Suppose $F_n \subseteq E \subseteq F$ for each $n$ and let $a \in A(\Delta, X, \mu)$ generate $E$ and $b \in A(\Delta, X, \mu)$ generate $F$. We will show that $F^a = \prod_n^a F_n/\mathcal{U} = \prod_n^b F_n/\mathcal{U} = F^b$.
(i) Suppose \([x_n]_U \hat{F}^a[y_n]_U\) and find \(g \in \Gamma\) with \(g^{0U}([x_n]_U) = [y_n]_U\) and \([x_n]_U \in A^a\), i.e., \(Un((x_n, g^a(x_n)) \in F_n)\). Write \(X = \bigsqcup_{d \in \Delta} X_d\), where \(X_d\) is Borel and
\[
x \in X_d \Rightarrow g^a(x) = d^b(x)
\]
(since \(E = E_a \subseteq E_b = F\)). Then \(X_U = \bigsqcup_{d \in \Delta} [X_d]_U\), so \([x_n]_U \in [X_d]_U\) for some \(d \in \Delta\) and therefore \(Un(x_n \in X_d)\), so that \(Un(g^a(x_n) = d^b(x_n))\) and thus \(g^{0U}([x_n]_U) = [y_n]_U = d^{0U}([x_n]_U)\). Moreover, \(Un((x_n, d^b(x_n)) \in F_n)\), i.e., \([x_n]_U \in A^d\), so \([x_n]_U \hat{F}^b[y_n]_U\).

(ii) Conversely assume that \([x_n]_U \hat{F}^b[y_n]_U\) and find \(d \in \Delta\) with \(d^{0U}([x_n]_U) = [y_n]_U\) and \(Un((x_n, d^b(x_n)) \in F_n)\). By Proposition 3.2, there is \(T \in [E]\) such that
\[(x, d^b(x)) \in E \Rightarrow d^b(x) = T(x)\]

Let then \(X = \bigsqcup_{g \in \Gamma} X_g\) be a Borel decomposition such that
\[
x \in X_g \Rightarrow T(x) = g^a(x),
\]
so that
\[
x \in X_g \& (x, d^b(x)) \in E \Rightarrow d^b(x) = g^a(x).
\]
Now \([x_n]_U \in [X_g]_U\) for some \(g \in \Gamma\), i.e., \(Un(x_n \in X_g)\). But also
\[Un((x_n, d^b(x_n)) \in F_n \subseteq E),\]
so \(Un(d^b(x_n) = g^a(x_n))\), i.e., \(d^{0U}([x_n]_U) = [y_n]_U = g^{0U}([x_n]_U)\) and moreover \(Un((x_n, g^a(x_n)) \in F_n)\), so \([x_n]_U \hat{F}^a[y_n]_U\).

89
16 Factors

(A) Factors in general. Let $E$ be a measure preserving countable Borel equivalence relation on $(X, \mu)$. Let $\mathcal{A} \subseteq \text{MALG} (= \text{MALG}_\mu)$ be a non-atomic, $\sigma$-subalgebra of MALG. Put

$$[E]^\mathcal{A} = \{ T \in [E] : \forall A \in \mathcal{A}(T(A), T^{-1}(A) \in \mathcal{A}) \}.$$ 

This is a closed subgroup of $([E], u)$, which we call the relative to $\mathcal{A}$ full group of $E$.

Consider now a separable subgroup $\Gamma$ of $(\text{Aut}(X, \mu), u)$. This defines a countable, measure preserving equivalence relation $F_\Gamma$ as follows: Let $\Gamma_0 \leq \Gamma$ be a countable dense subgroup of $\Gamma$ and let $F_\Gamma$ be the equivalence relation induced by $\Gamma_0$. We can easily see that this is independent of the choice of $\Gamma_0$ and moreover $\Gamma \leq [F_\Gamma]$.

Clearly $F_\Gamma$ is the smallest equivalence relation $F$ such that $\Gamma \leq [F]$. Kittrell-Tsankov [KT, 4.14] have shown that if $\Gamma$ is also closed in the uniform topology, then there is a largest equivalence relation $F$, denoted by $F_\Gamma$, such that $[F] \leq \Gamma$ and moreover $[F_\Gamma]$ is a normal subgroup of $\Gamma$.

We now say that $E$ is generated by $\mathcal{A}$ or that $\mathcal{A}$ generates $E$ if $F_{[E]^\mathcal{A}} = E$ (clearly always $F_{[E]^\mathcal{A}} \subseteq E$). This is equivalent to saying that there is a countable group $\Gamma$ and an action $a \in \text{MALG}_\mu(\Gamma, X, \mu)$ such that $E_a = E$ and $\mathcal{A}$ is invariant under $a$, i.e., for each $A \in \mathcal{A}, g \in \Gamma$ we have that $g^a(A) \in \mathcal{A}$.

Let now $\pi : (X, \mu) \to (Y, \nu)$ be the factor corresponding to $\mathcal{A}$, so that $(Y, \nu)$ is a standard (non-atomic) measure space, $\pi_* \mu = \nu$ and $B \mapsto \pi^{-1}(B)$ is an isomorphism of $(\text{MALG}_\nu, \nu)$ with $(\mathcal{A}, \mu | \mathcal{A})$ (see [K2, 17.43]). If $T \in \text{Aut}(X, \mu)$ preserves $\mathcal{A}$ (i.e., $\forall A \in \mathcal{A}(T(A), T^{-1}(A) \in \mathcal{A})$), then (via $\pi^{-1}$) it gives an automorphism of $\text{MALG}_\nu$, i.e., an element of $\text{Aut}(Y, \nu)$, denoted by $\hat{\pi}(T)$, such that $\hat{\pi}(T)(\pi(x)) = \pi(T(x))$. (To verify this equality, simply check that for every $B \in \text{MALG}_\nu$, $\hat{\pi}(T)(\pi(x)) \in B \iff \pi(T(x)) \in B$.) In particular, $\pi(x) = \pi(y) \implies \pi(T(x)) = \pi(T(y))$. So if

$$\text{Aut}(X, \mu)^\mathcal{A} = \{ T \in \text{Aut}(X, \mu) : \forall A \in \mathcal{A}(T(A), T^{-1}(A) \in \mathcal{A}) \},$$

then $\text{Aut}(X, \mu)^\mathcal{A}$ is a closed subgroup of $(\text{Aut}(X, \mu), u)$ and

$$\hat{\pi} : (\text{Aut}(X, \mu)^\mathcal{A}, u) \to (\text{Aut}(Y, \nu), u)$$

is a continuous homomorphism. In particular, $\hat{\pi}([E]^\mathcal{A})$ is a separable subgroup of $(\text{Aut}(Y, \nu), u)$ and thus gives rise to the equivalence relation $F = F^\hat{\pi}[E]^\mathcal{A}$. We call this the factor of $E$ relative to $\mathcal{A}$. 

90
Note that if \( \Gamma_0 \leq [E]^A \) is dense in \(([E]^A, u)\), so that \( \Gamma_0 \) generates \( E \), then \( \hat{\pi}(\Gamma_0) \) is dense in \((\hat{\pi}([E]^A), u)\) and so, by definition, it generates the factor \( F \). It follows that there is a countable group \( \Gamma \) and an action \( a \in A(\Gamma, X, \mu) \) preserving \( A \) with \( E_a = F \) such that if \( \hat{\pi}(a) = b \) is the factor action of \( a \) via \( \pi \) (i.e., \( g^b = \hat{\pi}(g^a) \) for each \( g \in \Gamma \)), so that
\[
\pi(g^a(x)) = g^b(\pi(x)),
\]
then we have \( E_b = F \). Therefore \( \pi \) is a homomorphism of \( E \) into \( F \), i.e.,
\[
x Ey \Rightarrow \pi(x) F \pi(y)
\]
and also \( \pi \) is class-surjective, i.e., the image of each \( E \)-class is an \( F \)-class. Moreover if \( c \in A(\Delta, X, \mu) \) is any action of a countable group \( \Delta \) preserving \( A \) with \( E_c = E \) and \( \hat{\pi}(c) = d \) is the factor action of \( c \) via \( \pi \), then \( E_d = F \). Indeed, let \( yFz \) and choose \( x \) with \( \pi(x) = y \) and \( g \in \Gamma \) with \( g^b(y) = z \). Then \( g^a(x) = h^c(x) \) for some \( h \in \Delta \), since \( E_a = E_c \), so \( \pi(g^a(x)) = g^b(\pi(x)) = g^b(y) = z = \pi(h^c(x)) = h^d(\pi(x)) = h^d(y) \), so \((y, z) \in E_d \). Thus \( F \subseteq E_d \). Since obviously \( E_d \subseteq F \), we are done.

Clearly \( \hat{\pi} \) is a homomorphism of \([E]^A \) into \([F]\). In fact we have:

**Proposition 16.1.** The homomorphism \( \hat{\pi} : [E]^A \rightarrow [F] \) is surjective.

**Proof.** Let \( S \in [F] \). Let \( a \in A(\Gamma, X, \mu) \), \( E_a = E \), \( \hat{\pi}(a) = b \), \( E_b = F \) as before. Then there is a Borel decomposition \( Y = \bigcup_{g \in \Gamma} Y_g \) such that
\[
y \in Y_g \Rightarrow S(y) = g^b(y).
\]
Let \( X_g = \pi^{-1}(Y_g) \in A \), so that \( X = \bigcup_{g \in \Gamma} X_g \). If \( g, h \in \Gamma \) are distinct, then \( g^b(Y_g) \cap h^b(Y_h) = S(Y_g) \cap S(Y_h) = \emptyset \) and \( \bigcup_{g \in \Gamma} g^b(Y_g) = \bigcup_{g \in \Gamma} S(Y_g) = Y \), so that \( g^a(X_g) \cap h^a(X_h) = \emptyset \) and \( X = \bigcup_{g \in \Gamma} g^a(X_g) \). Put \( T = \bigcup_{g \in \Gamma} g^b|X_g \).

First note that \( T \in [E]^A \), since if \( A \in A \), then \( T(A) = T(\bigcup_{g \in \Gamma} (A \cap X_g)) = \bigcup_{g \in \Gamma} g^a(A \cap X_g) \in A \). We will finally verify that \( \hat{\pi}(T) = S \). For that it is enough to check that for each \( B \in \text{MALG}_\nu \), \( g \in \Gamma \) we have that \( \hat{\pi}(T)(B \cap Y_g) = S(B \cap Y_g) \). This is the case, since \( \hat{\pi}(T)(B \cap Y_g) = \pi(T(\pi^{-1}(B) \cap X_g)) = \pi(g^a(\pi^{-1}(B) \cap X_g)) = g^b(B \cap Y_g) = S(B \cap Y_g) \).

The kernel of \( \hat{\pi} | [E]^A \) is equal to
\[
[E]_A = \{ T \in [E]^A : \forall A \in A(T(A) = A) \},
\]
thus \([F] \cong [E]^A/[E]_A\) (as topological groups). Note also that \(T \in [E]_A \iff T \in [E]^A \land \pi(T(x)) = \pi(x), \forall x\).

Let \(R_\pi\) be the kernel of \(\pi\), i.e., the smooth equivalence relation given by:

\[x R_\pi y \iff \pi(x) = \pi(y).\]

Put also

\[E_\pi = E \cap R_\pi.\]

Thus \([E]_A = [E_\pi]\).

It is easy to check that \(E, R_\pi\) commute, i.e., \(E \circ R_\pi = R_\pi \circ E\). (Here for any two equivalence relations \(E_1, E_2\), we define the relation \(E_1 \circ E_2\) by

\[x E_1 y \iff \exists z (x E_1 z \land z E_2 y).\]

We now have:

**Proposition 16.2.** Let \(F\) be a factor of \(E\), let \(S_0, S_1, \ldots \in [F]\) be such that \(F = E_{S_0, S_1, \ldots}\), and let \(T_0, T_1, \ldots \in [E]^A\) be such that \(\hat{\pi}(T_i) = S_i\). If \(E' = E_{T_0, T_1, \ldots}\), then \(E = E' \lor E_\pi\).

**Proof.** Let \(x E y\). Then \(\pi(x)F\pi(y)\), so for some \(i_1, \ldots, i_n\) we have \(\pi(y) = S_{i_1}^{\pm 1} \circ \cdots \circ S_{i_n}^{\pm 1}(\pi(x))\). Then if \(z = T_{i_1}^{\pm 1} \circ \cdots \circ T_{i_n}^{\pm 1}(x)\), we have \(\pi(z) = S_{i_1}^{\pm 1} \circ \cdots \circ S_{i_n}^{\pm 1}(\pi(x)) = \pi(y)\), so \(xE'z E_\pi y\). \(\square\)

The following result was shown by R. Tucker-Drob.

**Proposition 16.3 (R. Tucker-Drob).** Let \(S \in [F]\) be an involution. Then there is an involution \(T \in [E]^A\) with \(\hat{\pi}(T) = S\).

**Proof.** By Proposition 16.1, let \(\hat{T} \in [E]^A\) be such that \(\hat{\pi}(\hat{T}) = S\). We can define \(T(x) = x\) for all \(x\) such that \(S(\pi(x)) = \pi(x)\), so that working in the complement of the set of such \(x\) ’s, we can assume that \(S(\pi(x)) \neq \pi(x)\), for all \(x\). Let \(\Phi = \{\{x, x\}' : x Ex' \land S(\pi(x)) = \pi(x')\}\). Then, by [KM, Lemma 7.3], we can find a Borel set \(A \subseteq X\) and a Borel equivalence relation \(R\) on \(A\) such that \([x]_R \in \Phi\), for \(x \in A\) and if \(\{x, x\}' \cap A = \emptyset\), then \(\{x, x\}' \not\in \Phi\).

For \(x \in A\), we can define \(T(x) = x'\), where \(\{x, x\}' \in R\). Clearly \(\pi(T(x)) = S(\pi(x))\), so if we can show that \(A = X\) (modulo null sets), this will imply that \(T \in [E]^A\), \(T\) is an involution and \(\hat{\pi}(T) = S\).

Let \(B = \{x : \forall x'((xE x' \land \pi(x) = \pi(x')) \implies x' \in A\} \subseteq A\). Then by the properties of \(A, R\), we have that \(x \not\in A \implies \hat{T}(x) \in B\) (else there would be some \(x'\) such that \(x' \not\in A\) and \(\{x, x\}' \in \Phi\). Also \((X \setminus A) \cap T(B) \subseteq (X \setminus A) \cap A = \emptyset\) and \(T(B) \subseteq \hat{T}^{-1}(B)\). Therefore \(X \setminus A \subseteq \hat{T}^{-1}(B) \setminus T(B)\) and since \(\mu(\hat{T}^{-1}(B)) = \mu(T(B)) = \mu(B),\) \(X \setminus A\) is null. \(\square\)
Corollary 16.4. If $E$ is generated by the $\sigma$-subalgebra $\mathcal{A}$, then there are involutions $T_0, T_1, \ldots \in [E]^{\mathcal{A}}$ such that $E = E_{T_0, T_1, \ldots}$.

Proof. Let $S_0, S_1, \ldots \in [F]$ be involutions such that $F = E_{S_0, S_1, \ldots}$. By Proposition 16.3, let $U_0, U_1, \ldots \in [E]^{\mathcal{A}}$ be involutions such that $\hat{\pi}(U_i) = S_i$. Let $E' = E_{U_0, U_1, \ldots}$. Then, by Proposition 16.2, $E = E' \lor E_{\pi}$.

Now let $V_0, V_1, \ldots$ be involutions in $[E_{\pi}]$ such that $E_{\pi} = E_{V_0, V_1, \ldots}$. Clearly $V_0, V_1, \ldots \in [E]^{\mathcal{A}}$ and so if $\{T_0, T_1, \ldots\} = \{U_0, U_1, \ldots\} \cup \{V_0, V_1, \ldots\}$, then $T_0, T_1, \ldots \in [E]^{\mathcal{A}}$ and $E = E_{T_0, T_1, \ldots}$. $\square$

We next show the following.

Theorem 16.5. The composition of factors is a factor.

Proof. Let $E$ live on $(X, \mu)$, $\pi: (X, \mu) \to (Y, \nu)$ be the factor corresponding to the $\sigma$-subalgebra $\mathcal{A} \subseteq \text{MALG}_\mu$ which generates $E$ and let $F$ be the corresponding factor. Let also $\mathcal{B}$ be a $\sigma$-subalgebra of $\text{MALG}_\nu$ such that $F$ is generated by $\mathcal{B}$ and let $\rho: (Y, \nu) \to (Z, \omega)$ and $H$ be the factor equivalence relation corresponding to $\mathcal{B}$. Let $\sigma = \rho \circ \pi: (X, \mu) \to (Z, \omega)$ be the composition with associated $\sigma$-subalgebra $\mathcal{C} = \pi^{-1}(\mathcal{B}) \subseteq \mathcal{A}$. We will show that $H$ is the factor of $E$ corresponding to $\mathcal{C}$.

Lemma 16.6. $[F]^{\mathcal{B}} = \hat{\pi}([E]^{\mathcal{C}} \cap [E]^{\mathcal{A}})$.

Proof. Since $\hat{\pi}([E]^{\mathcal{A}}) = [F]$, this is clear from the definitions noting that if $T \in [E]^{\mathcal{A}}$, then $T \in [E]^{\mathcal{C}}$ iff $\hat{\pi}(T) \in [F]^{\mathcal{B}}$. $\square$

Proof. Let $T \in [E]^{\mathcal{A}}$. Then $\hat{\pi}(T) \in [F]$, so, since $F = F([F]^{\mathcal{B}})$, we can find $S_i$ in $[F]^{\mathcal{B}}$ and disjoint Borel sets $Y_i \subseteq Y$ with $\bigsqcup_i Y_i = Y$ such that $\hat{\pi}(T) = \bigsqcup_i S_i |_{Y_i}$.

By Lemma 16.6, let $T_i \in [E]^{\mathcal{C}} \cap [E]^{\mathcal{A}}$ be such that $\hat{\pi}(T_i) = S_i$, so that $\hat{\pi}(T) = \bigsqcup_i \hat{\pi}(T_i) |_{Y_i}$. Then for each $i$, $\hat{\pi}(T_i) |_{Y_i} = \hat{\pi}(T_i) |_{Y_i} = \hat{\pi}(T_i^{-1}T_i) |_{Y_i} = \hat{\pi}(T_i^{-1}) |_{Y_i} = *d|_{Y_i}$.

Let $X_i = \pi^{-1}(Y_i) \subseteq \mathcal{A}$. It follows that $T_i^{-1}T(A) = A$ for any $A \subseteq X_i$ and in particular $T_i^{-1}T(X_i) = X_i$. Since $X = \bigsqcup_i X_i, U = \bigsqcup_i (T_i^{-1}T) |_{X_i} \in [E]^{\mathcal{A}}$. Moreover $U(A) = A$ for every $A \subseteq \mathcal{A}$, so that actually $U \in [E]_{\mathcal{A}} \subseteq [E]^{\mathcal{C}}$.

Now for each $x$, there is $i$ such that $T_i^{-1}T(x) = U(x)$ or $T(x) = T_i U(x)$. Since $T_i U \in [E]^{\mathcal{C}} \cap [E]^{\mathcal{A}}$, we have that $T \in [E]^{\mathcal{C}} \cap [E]^{\mathcal{A}}$. But $E = F([E]^{\mathcal{C}}$, so $E = F([E]^{\mathcal{C}} \cap [E]^{\mathcal{A}})$. $\square$
We now complete the proof of Theorem 16.5 as follows. Let $\Gamma_0 \leq [E]^C \cap [E]^A$ be a countable dense subgroup of $[E]^C \cap [E]^A$, which therefore generates $E$. Then $\hat{\pi}(\Gamma_0)$ is a dense subgroup of $[E]^B$, so $\hat{\rho} \circ \hat{\pi}(\Gamma_0) = \hat{\sigma}(\Gamma_0)$ generates $H$. By the arguments preceding Proposition 16.1, it follows that $H$ is the factor of $E$ corresponding to $C$.

It also follows from the preceding argument that there is a countable group $\Gamma$ and an action $a \in A(\Gamma, X, \mu)$, preserving both $A$ and $C$, such that $E_n = E$, and moreover if $\hat{\pi}(a) = b$, then $E_b = F$ and $b$ preserves $B$ and if $\hat{\rho}(b) = \hat{\rho}(\hat{\pi}(a)) = c$, then $E_c = H$.

This can be extended to infinite chains as follows.

For each $n \in \mathbb{N}$, let $E_n$ be an equivalence relation on $(X_n, \mu_n)$ and for each $n \geq 1$, let $\pi_n: (X_n, \mu_n) \to (X_{n-1}, \mu_{n-1})$ be the map corresponding to a $\sigma$-subalgebra $A_n \subseteq \text{MALG}^{\mu_n}$, which generates $E_n$, and let $E_{n-1}$ be the factor corresponding to $A_n$. For $n \geq m$, let $\pi_{n,m} = \pi_m \circ \cdots \circ \pi_{n-1} \circ \pi_n$, so that $\pi_{n,n} = \text{id}$ and $\pi_{n,n-1} = \pi_n$. Put $A_{n,m} = \pi_{n,m}^{-1}(\text{MALG}^{\mu_n})$, so that $A_{n,n-1} = A_n$ and $A_{n,n} = \text{MALG}^{\mu_n}$. Thus we have the following $\sigma$-subalgebras of $\text{MALG}^{\mu_n}$,

$$A_{n,0} \subseteq A_{n,1} \subseteq \cdots \subseteq A_{n,n-1} = A_n \subseteq A_{n,n} = \text{MALG}^{\mu_n}.$$

Put

$$[E_n]^* = [E_n]^{A_{n,0}} \cap \cdots \cap [E_n]^{A_{n,n-1}}.$$

Then we have, generalizing Lemmas 16.6, 16.7:

**Proposition 16.8.** For each $n \geq 1$,

(i) $\hat{\pi}_n([E_n]^*) = [E_{n-1}]^*$,

(ii) $E_n = F[E_n]^*$.

**Proof.** By induction on $n \geq 1$. The case $n = 1$ is clear. So assume that (i), (ii) hold for $n - 1 \geq 1$ and prove them for $n$. First we will show that if we assume (i) for $n$, then (ii) also holds for $n$. The proof is similar to that of Lemma 16.7.

Let $T \in [E_n]^{A_n}$. Then $\hat{\pi}_n(T) \in [E_{n-1}]$, so by (ii) for $n - 1$, there is a sequence $S_i \in [E_{n-1}]^*$ and $Y_i \in \text{MALG}^{\mu_{n-1}}$ such that $\bigcup_i Y_i = Y$ and $\hat{\pi}_n(T) = \bigcup_i (S_i|Y_i)$. Let then, using (i) for $n$, $T_i \in [E_n]^*$ be such that $\hat{\pi}_n(T_i) = S_i$. Then $\hat{\pi}_n(T) = \bigcup_i (\hat{\pi}_n(T_i)|Y_i)$, so $\hat{\pi}_n(T_i^{-1}T)|Y_i = \text{id}|Y_i$. Let $X_i = \pi_{n,1}^{-1}(Y_i) \subseteq A_n$. Then for any $A \subseteq X_i, A \in A_n, T_i^{-1}T(A) = A$, so, in particular, $T_i^{-1}T(X_i) = X_i$. Since $X = \bigcup_i X_i$, we have that $U = \bigcup_i (T_i^{-1}T) \in [E]$. Also $U(A) = A$ for $A \in A_n$, so $U \in [E_n]_{A_n} \subseteq [E_n]^*$. Now for each $x \in X_n$, there is $i$ such
that \( U(x) = T^{-1}T(x) \), i.e., \( T(x) = T_1U(x) \). Since \( T_1U \in [E_n]^* \), this shows that \( T \in [F[E_n]^*] \), thus \( E_n \subseteq F[E_n]^* \subseteq E_n \), so (ii) holds.

We now prove (i) for \( n \). Clearly \( \hat{\pi}_n([E_n]^*) \subseteq [E_n-1]^* \). Conversely, if \( S \in [E_n-1]^* \), let \( T \in [E_n]^A_n \) be such that \( \hat{\pi}_n(T) = S \). Since \( S \) keeps invariant the \( \sigma \)-subalgebras \( A_{n-1,0}, \ldots, A_{n-1,n-2} \), clearly \( T \) keeps invariant

\[
A_{n,0} = \pi_n^{-1}(A_{n-1,0}), \ldots, A_{n,n-2} = \pi_n^{-1}(A_{n-1,n-2}), A_{n,n-1},
\]

so \( T \in [E_n]^* \). \( \square \)

Consider now the inverse limit \( (X_\infty, \mu_\infty) \) of the sequence \( (X_n, \mu_n), \pi_n \). Denote by \( \pi_{\infty,n}: (X_\infty, \mu_\infty) \to (X_n, \mu_n) \) the associated maps, so that \( \pi_{n,m} \circ \pi_{\infty,m} = \pi_{\infty,n,m} \) for \( n \geq m \). Thus \( X_\infty \) consist of all chains \( (x_n) \in \prod_n X_n \) with \( \pi_n(x_n) = x_{n-1}, \) for \( n \geq 1 \), \( \pi_\infty((x_n)) = x_n \) and MALG\( _{\mu_\infty} \) is the smallest \( \sigma \)-algebra containing the \( \sigma \)-subalgebras

\[
A_{\infty,0} = \pi_{\infty,0}^{-1}(\text{MALG}_{\mu_0}) \subseteq A_{\infty,1} = \pi_{\infty,1}^{-1}(\text{MALG}_{\mu_1}) \subseteq \ldots
\]

We will show next that there is a countable group \( \Gamma \) and a measure preserving action \( a_\infty \in A(\Gamma, X_\infty, \mu_\infty) \), which keeps all the \( A_{\infty,n} \) invariant, thus factors to a measure preserving action \( \hat{\pi}_{\infty,n}(a_\infty) = a_n \in A(\Gamma, X_n, \mu_n) \), which has moreover the property that \( E_{a_n} = E_n \). Then if we put \( E_{a_\infty} = E_\infty \), it follows that the factor of \( E_\infty \) via \( \pi_{\infty,n} \) is exactly \( E_n \) and the appropriate diagrams commute.

To construct \( a_\infty \), let, for each \( m \), \( T_0^m, T_1^m, \ldots, T_i^m, \ldots \) be in \( [E_n]^* \) and generate \( E_m \) (using Proposition 16.8). For \( n \leq m \), let \( T_{i,n}^m = \hat{\pi}_{n,i}(T_i^m) \) and for \( n > m \) choose \( T_{i,n}^m \in [E_n]^* \) such that \( \hat{\pi}_{n+1}(T_{i,n+1}^m) = T_i^m \) for \( n \geq m \) (again using Proposition 16.8). Finally let \( T_i^{m,\infty}(x_n) \) be \( (x_n) \) for \( n \geq 0 \). Note that \( T_i^{m,\infty} \) leaves each \( A_{\infty,n} \) invariant and \( \hat{\pi}_{\infty,n}(T_i^{m,\infty}) = T_i^{m,n} \).

Let \( \Gamma \) be the free group with infinitely many generators \( g_{i,m} \) and let it act in a measure preserving way on \( (X_\infty, \mu_\infty) \) to produce \( a_\infty \), where \( g_{i,m}^a = T_i^{m,\infty} \). If \( \hat{\pi}_{\infty,n}(a_\infty) = a_n \), then \( g_{i,m}^a = \hat{\pi}_{\infty,n}(T_i^{m,\infty}) = T_i^{m,n} = T_i^n \), so \( E_{a_n} = E_n \) and thus the factor of \( E_\infty \) by \( \pi_{\infty,n} \) is equal to \( E_n \), which completes the proof.

Although \( E_\infty \) is an “upper bound” for the inverse system \( (E_n) \), it is not clear how to construct a canonical upper bound, i.e., an inverse limit in the categorical sense for this inverse system.

Next we show that hyperfiniteness is preserved under factoring.
Proposition 16.9. If $E$ is hyperfinite and $F$ is a factor of $E$, then $F$ is hyperfinite.

Proof. Let $\pi: (X, \mu) \rightarrow (Y, \nu)$ be the factor map and let $a \in A(\Gamma, X, \mu)$ be such that $E_a = E$, $\hat{\pi}(a) = b$ and $E_b = F$. For $y \in Y$, let $X_y = \{x \in X: \pi(x) = y\}$ and let $\mu_y$ be the probability measure on $X_y$ associated with the measure disintegration of $\pi$. Since $E$ is amenable, let $\lambda^n: E \rightarrow [0, 1]$ be Borel functions such that

$$\sum_{x' \in E} \lambda^n(x, x') = 1,$$

$$||\lambda^n_x - \lambda^n_u||_1 \rightarrow 0,$$

for $xEu$, as $n \rightarrow \infty$ (see [KM, Section 9]).

Define now $\rho^n: F \rightarrow [0, 1]$ by

$$\rho^n(y, y') = \int_{X_y \times E x, \pi(x') = y'} \sum_{x' \in E} \lambda^n(x, x') d\mu_y(x) \in [0, 1].$$

We will show that

$$\sum_{y \in Fv} \rho^n(y, y') = 1,$$

$$||\rho^n_y - \rho^n_v||_1 \rightarrow 0,$$

for $yFv$, as $n \rightarrow \infty$, which implies that $F$ is amenable, thus hyperfinite (see [KM, Section 10]).

The first equality is easy to check, so we verify the second. Fix $\gamma \in \Gamma$ such that $\gamma \cdot y = v$. Then $\gamma \cdot X_y = X_v$ and $\gamma \cdot \mu_y = \mu_v$. Now for each $y'Fy$, we have

$$\rho^n_y(y') = \int_{X_y \times E x, \pi(x') = y'} \sum_{x' \in E} \lambda^n(x, x') d\mu_y(x),$$

and

$$\rho^n_v(y') = \int_{X_v \times E x, \pi(x') = y'} \sum_{x' \in E} \lambda^n(x, x') d\mu_v(x),$$

so

$$\rho^n_v(y') = \int_{X_v \times E x, \pi(x') = y'} \sum_{x' \in E} \lambda^n(\gamma \cdot x, x') d\mu_y(x).$$

It follows that

$$||\rho^n_y - \rho^n_v||_1 \leq \int_{X_y} ||\lambda^n_x - \lambda^n_{\gamma \cdot x}||_1 d\mu_y(x) \rightarrow 0,$$
Remark 16.10. Standard factors of the ultraproduct $\prod_n F_n/U$ (which was defined in Section 15), can be constructed as in the proof of Theorem 14.10.

(B) Class-bijective factors. We now consider the following notion that has been considered in the literature, see Feldman-Sutherland-Zimmer [FSZ]). A measure preserving countable Borel equivalence relation $F$ on $(Y,\nu)$ is called a **class-bijective factor** of a measure preserving countable Borel equivalence relation $E$ on $(X,\mu)$ if there is Borel $\pi: (X,\mu) \to (Y,\nu)$ with $\pi_*\mu = \nu$, $\pi: E \to F$ a homomorphism (i.e., $xEx' \Rightarrow \pi(x)F\pi(x')$) such that moreover for each $E$-class $[x]_E$ the map $\pi$ is a bijection of $[x]_E$ with $[\pi(x)]_F$. In this case we also call the map $\pi$ **class-bijective**. For example, let $E$ be measure preserving on $(X,\mu)$, $A \subseteq \text{MALG}_\mu$ a $\sigma$-subalgebra which generates $E$, $\pi: (X,\mu) \to (Y,\nu)$ the corresponding map, $a \in A(\Gamma,X,\mu)$ with $E_a = E$ leaving $A$ invariant, $\hat{\pi}(a) = b$ and $F = E_b$. If $b$ is free, then $F$ is a class-bijective factor of $E$.

**Proposition 16.11.** A class-bijective factor is a factor in the sense of Section 16, (A).

**Proof.** Let $b \in A(\Gamma,Y,\nu)$ be such that $E_b = F$. Define then $a \in A(\Gamma,X,\mu)$ by

$$g^a(x) = x' \iff xEx' & g^b(\pi(x)) = \pi(x').$$

Then $\pi(g^a(x)) = g^b(\pi(x))$. Let $A$ be the $\sigma$-subalgebra of $\text{MALG}_\mu$ corresponding to $\pi$. Clearly $a$ preserves $A$, since $g^a(\pi^{-1}(A)) = \pi^{-1}(g^b(A))$, for any $A \in \text{MALG}_\nu$, and $E_a = E$ while $\hat{\pi}(a) = b$, so $F$ is a factor in the preceding sense.

Thus a class-bijective factor is a factor $\pi$ for which $E_\pi = id$. In fact it turns out that the class-bijective factors of a measure preserving countable Borel equivalence relation $E$ on $(X,\mu)$ correspond exactly to smooth equivalence relations $R_\pi$ that commute with $E$ and are orthogonal to $E$ in the sense that $E_\pi = R_\pi \cap E = id$. Indeed, if $F$ on $Y$ is a class-bijective factor of $E$ via $\pi$, then $E, R_\pi$ commute and $E_\pi = id$.

Conversely if $E, R_\pi$ commute and $E_\pi = id$, define the following relation on $Y$:

$$xFy \iff \exists x' \exists y'(x'Ey' \land \pi(x') = x \land \pi(y') = y).$$

97
Then $F$ is an equivalence relation on $Y$ (transitivity follows from the commutativity of $E, R$). It is clearly analytic. It is also coanalytic, since, by the commutativity of $E, R$, we also have:

$$xFy \iff \forall x' (\pi(x') = x \implies \exists y'(x'Ey' \land \pi(y') = y)).$$

Thus $F$ is Borel. Moreover the map $\pi$ is bijective from $[x]_E$ to $[\pi(x)]_E$ (using that $E_\pi = id$), and so, in particular, $F$ is a countable equivalence relation. Finally, it is easy to verify that $F$ is measure preserving.

Since $[E_\pi] = [E]_A$ we also immediately have:

**Proposition 16.12.** Assume that $E$ on $(X, \mu)$ is generated by the $\sigma$-subalgebra $A \subseteq \text{MALG}$ with corresponding map $\pi: (X, \mu) \to (Y, \nu)$ and factor $F$. Then $\pi$ is class-bijective iff $[E]_A$ is trivial, i.e., $\hat{\pi}$ is an isomorphism of $[E]_A$ with $[F]$.

We will next characterize which factors are class-bijective. Below for each $T \in \text{Aut}(X, \mu)$, we let as usual $\text{supp}(T) = \{x: T(x) \neq x\}$.

**Proposition 16.13.** Assume that $E$ on $(X, \mu)$ is generated by the $\sigma$-subalgebra $A \subseteq \text{MALG}$ with corresponding map $\pi: (X, \mu) \to (Y, \nu)$ and factor $F$. Then $\pi$ is class-bijective iff for each $T \in [E]_A$, $\text{supp}(T) = \pi^{-1}(\text{supp}(\hat{\pi}(T)))$.

**Proof.** First note that for any $T \in [E]_A$, we have

$$\hat{\pi}(T)(\pi(x)) \neq \pi(x) \iff \pi(T(x)) \neq \pi(x),$$

so

$$\pi^{-1}(\text{supp}(\hat{\pi}(T))) \subseteq \text{supp}(T).$$

Now assume that $\pi$ is class-bijective. Let $T \in [E]_A$ and $T(x) \neq x$. Then as $\pi$ is 1-1 on $[x]_E$, $\hat{\pi}(T)(\pi(x)) \neq \pi(x)$, so $\pi^{-1}(\text{supp}(\hat{\pi}(T))) \supseteq \text{supp}(T)$.

Conversely, assume that $\pi^{-1}(\text{supp}(\hat{\pi}(T))) \supseteq \text{supp}(T)$ and let $x \neq x' \in [x]_E$. Then for some $T \in [E]_A$ we have $T(x) = x'$, so $x \in \text{supp}(T)$, thus $\pi(x) \in \text{supp}(\hat{\pi}(T))$, so $\pi(x') = \pi(T(x)) = \hat{\pi}(T)(\pi(x)) \neq \pi(x)$, i.e., $\pi$ is 1-1 on $[x]_E$.

From Proposition 16.13, and using its notation, we see that if $\pi$ is class-bijective, then for $T \in [E]_A$ we have that $\text{supp}(T) \in A$. Conversely this last condition almost characterizes class-bijective factors. Recall that $\pi$ is class-bijective iff $\text{card}([x]_E_\pi) = 1$, for all $x$. 98
Proposition 16.14. Assume that $E$ on $(X, \mu)$ is generated by the $\sigma$-subalgebra $\mathcal{A} \subseteq \text{MALG}$ with corresponding factor map $\pi: (X, \mu) \rightarrow (Y, \nu)$. If for every $T \in [E]^A$, supp$(T) \in \mathcal{A}$, then card$([x]_{E_{\pi}}) \leq 2$, for all $x$.

Proof. Assume the conclusion fails, towards a contradiction. Let $A_{\infty} = \{x: \text{card}([x]_{E_{\pi}}) = \infty\}$ and $A_{\geq 3} = \{x: \infty > \text{card}([x]_{E_{\pi}}) \geq 3\}$. Then one of these two sets has positive measure.

Case 1. $\mu(A_{\infty}) > 0$. Let then $B \subseteq A_{\infty}$ be a Borel set such that both $B$ and $A_{\infty} \setminus B$ meet every $E_{\pi}|A_{\infty}$ class. The by [K, 4.10] there is $T_0 \in [E_{\pi}|A_{\infty}]$ with supp$(T_0) = B$. Extend $T_0$ to $T \in [E_{\pi}] = [E]_\mathcal{A}$ by letting $T(x) = x$ for $x \notin A_{\infty}$. Then supp$(T) = B$ but $B$ is not $E_{\pi}$-invariant, so $B \notin \mathcal{A}$, a contradiction.

Case 2. $\mu(A_{\geq 3}) > 0$. Let then $C \subseteq A_{\geq 3}$ be a Borel selector for $E_{\pi}|A_{\geq 3}$. Then $\mu(C) > 0$. Define $T_1 \in [E_{\pi}|A_{\geq 3}]$ so that $x \in C \implies (T_1(x) \neq x \land T_2(x) = x)$ and $x \notin (C \cup T_1(C)) \implies T_1(x) = x$. Extend $T_1$ to $T \in [E_{\pi}]$ by letting $T(x) = x$ if $x \notin A_{\geq 3}$. Since supp$(T) = C \cup T(C)$ is not $E_{\pi}$-invariant, so not in $\mathcal{A}$, we again have a contradiction.

That the conclusion of Proposition 16.14 cannot be strengthened to $\pi$ being class-bijective can be seen from the following example. Let $E$ on $(Y, \nu)$ be given, let $X = Y \times \{0,1\}$, with the product measure $\mu$, and let $(x,i)E(y,j) \iff xFy$. Then for $\pi: X \rightarrow Y$ the projection function, the hypothesis of Proposition 16.14 is satisfied but $\pi$ is clearly not class-bijective.

Class-bijective factors can be also characterized, in the ergodic case, in terms of skew products. Let $F$ be a measure preserving equivalence relation on $(Y, \nu)$ Let $(Z, \sigma)$ be a standard, not necessarily non-atomic, measure space and let $\alpha: F \rightarrow \text{Aut}(Z, \sigma)$ be a Borel cocycle, i.e., $\alpha(x, z) = \alpha(y, z)\alpha(x, y)$ for $xFyFz$ (in an $F$-invariant set of measure 1). Let $X = Y \times Z$, $\mu = \nu \times \sigma$ and define the skew product equivalence relation $E$ on $X$, in symbols

$$E = F \times_{\alpha} (Z, \sigma),$$

by

$$(x, z)E(y, w) \iff xFy \& \alpha(x, y)(z) = w.$$

Let $p: X \rightarrow Y$ be the projection map $p(y, z) = y$. Let $a \in A(\Gamma, Y, \nu)$ be such that $E_a = F$. Let also $\alpha^*(g, y) = \alpha(y, g^0(y))$. Then if $b = a \times_{\alpha^*} (Z, \sigma)$ is the skew product action (see [K, Section 10, (E)]), we have $E_b = E$ and since

99
\( \hat{p}(b) = a \), it follows that \( F \) is the factor of \( E \) corresponding to \( p \). Moreover it is easy to see that it is class-bijective.

Conversely, the proof of Rokhlin’s Skew Product Theorem (see Glasner [Gl], 3.18) shows that if \( F \) on \((Y, \nu)\) is a class-bijective factor of an ergodic \( E \) on a space \((X, \mu)\) via \( \pi: (X, \mu) \to (Y, \nu) \), then there is a standard, not necessarily non-atomic, space \((Z, \sigma)\), a Borel cocycle \( \alpha: F \to \text{Aut}(Z, \sigma) \) and an isomorphism \( \varphi: (X, \mu) \to (Y \times Z, \nu \times \sigma) \) of \( E \) with \( F \times \alpha (Z, \sigma) \) such that \( p \circ \varphi = \pi \).

If \( F \) on \((Y, \nu)\) is a (class-bijective) factor of \( E \) on \((X, \mu)\) via \( \pi \), we say that \( E \) is a (class-bijective) extension of \( F \) via \( \pi \). Given two such extensions \( E, E' \) of \( F \) on \((X, \mu), (X', \mu') \) via \( \pi, \pi' \), we say that they are isomorphic if there is an isomorphism \( \varphi: (X, \mu) \to (X', \mu') \) of \( E \) with \( E' \) with \( \pi' \circ \varphi = \pi \). Thus we have shown the following:

**Theorem 16.15.** Let \( F \) be an ergodic measure preserving equivalence relation on \((Y, \nu)\). Let \( E \) be an ergodic extension of \( F \) on \((X, \mu)\) via \( \pi: (X, \mu) \to (Y, \nu) \). Then the following are equivalent:

(i) \( E, \pi \) is a class-bijective extension of \( F \).

(ii) \( E, \pi \) is isomorphic to a skew product extension of \( F \).

Concerning the question of inverse limits for systems \(((X_n, \mu_n), \pi_n, E_n)\) we note that if we restrict ourselves to the category of class-bijective factors, i.e., if in this system every factor is class-bijective, then it is easy to see that there is indeed a canonical inverse limit \( E_\infty = \lim_{\leftarrow} E_n \) on \((X_\infty, \mu_\infty)\), given by

\[
(x_n)_{E_\infty}(y_n) \iff \forall n (x_n E_n y_n).
\]

This follows from the “unique lifting property” given in Theorem 16.12, which implies that if \( a_0 \in A(\Gamma, X_0, \mu_0) \) is such that \( E_{a_0} = E_0 \), then there are unique \( a_n \in A(\Gamma, X_n, \mu_n) \) with \( \hat{\pi}_{n,m}(a_n) = a_m \) for \( n \geq m \) and \( a_\infty \in A(\Gamma, X_\infty, \mu_\infty) \) with \( \hat{\pi}_{\infty,n}(a_\infty) = a_n \) such that \( E_{a_n} = E_n, E_{a_\infty} = E_\infty \).

The following is an interesting open problem:

**Problem 16.16.** If \( E \) is treeable and \( F \) is a class-bijective factor of \( E \), is \( F \) treeable?

Note that a positive answer implies that every countable treeable group \( \Gamma \) is strongly treeable. (Recall that a countable group \( \Gamma \) is treeable if there is some free \( a \in A(\Gamma, X, \mu) \) with \( E_a \) treeable, while it is strongly treeable if this holds for every free \( a \in A(\Gamma, X, \mu) \).

Indeed let \( a \in A(\Gamma, X, \mu) \) be free
with $E_a$ treeable and consider any free $b \in A(\Gamma, Y, \nu)$. Let $a \times b$ be the product of $a, b$. Then $E_{a \times b}$ is a class-bijective extension of $E_a$, so it is treeable. Also $E_b$ is a class-bijective factor of $E_{a \times b}$, so, if the answer to Problem 16.16 is positive, $E_b$ is treeable.

(C) Other notions of factors. In the preceding we have considered two categories whose objects are triples $(X, \mu, E)$, with $E$ a countable measure preserving Borel equivalence relation on $(X, \mu)$.

(1) In the first category, the morphisms $\pi: (X, \mu, E) \to (Y, \nu, F)$ are measure preserving Borel maps $\pi: (X, \mu) \to (Y, \nu)$ with $\pi: E \to F$ a **class-bijective homomorphism**, i.e., for each $x \in X$, $\pi$ is a bijection of $[x]_E$ with $[\pi(x)]_F$. (The notation $\pi: E \to F$, which more accurately should be written as $\pi \times \pi: E \to F$, indicates that $\pi$ is a homomorphism of $E$ into $F$.)

(2) In the second category, the morphisms $\pi: (X, \mu, E) \to (Y, \nu, F)$ are measure preserving Borel maps $\pi: (X, \mu) \to (Y, \nu)$ such that if $A \subseteq \text{MALG}_\mu$ is the $\sigma$-algebra associated to $\pi$, then $[E]^A$ generates $E$ and $\hat{\pi}([E]^A)$ generates $F$ (or equivalently there is Borel action $a$ of a countable group $\Gamma$ preserving $A$, such that $E_a = E$ and $E_{\hat{\pi}(a)} = F$).

Robin Tucker-Drob (unpublished) considered the following two additional categories with the same objects $(X, \mu, E)$.

(3) In the third category, the morphisms $\pi: (X, \mu, E) \to (Y, \nu, F)$ are measure preserving Borel maps $\pi: (X, \mu) \to (Y, \nu)$ with $\pi: E \to F$ a **class-surjective homomorphism**, i.e., for each $x \in X$, $\pi$ is a surjection of $[x]_E$ with $[\pi(x)]_F$. Note that a class-surjective homomorphism is a morphism in the sense of the second category (i.e., that of Section 16, (A)) iff the homomorphism $\hat{\pi}: [A]^A \to [F]$ is surjective. One direction follows from Proposition 16.1. For the other direction, recall that $xR_\pi y \iff \pi(x) = \pi(y)$ and $E_\pi = E \cap R_\pi$. Let $S_0, S_1, \ldots \in [F]$ generate $F$ and let $T_0, T_1, \ldots \in [E]^A$ be such that $\hat{\pi}(T_i) = S_i$. Let also $U_0, U_1, \ldots \in [E_\pi]$ generate $E_\pi$. Then $T_0, T_1, \ldots, U_0, U_1, \ldots$ generate $E$ and of course $\hat{\pi}(T_0), \hat{\pi}(T_1), \ldots$ generate $F$.

(4) Finally, in the fourth category, the morphisms $\pi: (X, \mu, E) \to (Y, \nu, F)$ are measure preserving Borel maps $\pi: (X, \mu) \to (Y, \nu)$ with $\pi: E \to F$ a **surjective homomorphism** (i.e., $(\pi \times \pi)(E) = F$).

Note that the categories above have the same objects but increasingly more general morphisms.

101
(D) An application to soficity. We start with the following proposition.

**Proposition 16.17.** Let $F$ be a class-surjective factor of $E$ via $\pi$. Assume that $F$ is treeable. Then the following are equivalent:

(i) $F$ is a factor of $E$ via $\pi$.

(ii) There is Borel $E' \subseteq E$ such that $F$ is a class-bijective factor of $E'$ via $\pi$ and $E = E' \vee E_\pi$.

**Proof.** (ii) $\implies$ (i): Let $T_0, T_1, \cdots \in [E_\pi]$ generate $E_\pi$. If $A$ is the $\sigma$-algebra corresponding to $\pi$, clearly $T_n \in [E]_A$. Let also $T'_0, T'_1, \cdots \in [E']_A \subseteq [E]_A$ generate $E'$ with $\hat{\pi}(T'_0), \hat{\pi}(T'_1), \cdots$ generating $F$. Then $T_0, T_1, \cdots, T'_0, T'_1, \cdots$ generate $E$. Note that we have only used that $F$ is a factor of $E'$ here.

(i) $\implies$ (ii): Fix a Borel treeing of $F$ (i.e., a Borel acyclic graph whose connected components are the $F$-classes). Using a Borel edge coloring of this treeing with countably many colors (see [KST, Proposition 4.10]), we can find a (finite or infinite) sequence $S_0, S_1, \cdots$ of Borel involutions generating this treeing, so that if $m \neq n$ and $S_m(x) = y$ with $x \neq y$, then $S_n(x) \neq y$.

By Proposition 16.3, let $T_n \in [E]_A$ be an involution such that $\hat{\pi}(T_n) = S_n$. We can clearly assume that $T_n$ is chosen so that $T_n(x) = x$ if $S_n(\pi(x)) = \pi(x)$. Let $E'$ be the equivalence relation generated by the $T_n$, so that $E' \subseteq E$. We will show that $\pi$ is a class-bijective homomorphism of $E'$ to $F$.

Clearly $\pi$ is a class-surjective homomorphism of $E'$ to $F$. To check that it is class-bijective, let $x' E' y'$, $x' \neq y'$ but, towards a contradiction, $\pi(x') = \pi(y')$. Let $n$ be least such that we can find $T_{i_1}, T_{i_2}, \ldots, T_{i_n}$ with $T_{i_1} \circ T_{i_2} \circ \cdots \circ T_{i_n}(x') = y'$ and therefore $S_{i_1} \circ S_{i_2} \circ \cdots \circ S_{i_n}(\pi(x')) = \pi(y')$, contradicting the acyclicity of the treeing.

Finally $E = E' \vee E_\pi$ follows from Proposition 16.2.

**Definition 16.18.** Let $F$ be a countable measure preserving Borel equivalence relation on $(Y, \nu)$. We say that $F$ is **unfoldable** if for any $E$ on $(X, \mu)$ which factors to $F$ via $\pi$: $(X, \mu) \rightarrow (Y, \nu)$, there is $E' \subseteq E$ such that $F$ is a class-bijective factor of $E'$ via $\pi$.

Thus every treeable equivalence relation is unfoldable. For the next result recall the notion of a **sofic** equivalence relation introduced in [EL]. See also [CKT, Definition 10.1] for an alternative description due to Ozawa that we will use below.

**Proposition 16.19.** Every unfoldable equivalence relation is sofic.
**Proof.** First notice that every $F$ is a factor of an $E$ that is given by a free action of $F_{\infty}$. Indeed let $a$ be an action of $F_{\infty}$ such that $F = E_a$ and let $b$ be a free action of $F_{\infty}$. Then take $E = E_{a \times b}$. Since $E$ is given by a free action of the group $F_{\infty}$, $E$ is sofic (this follows from the fact that $F_{\infty}$ has property MD – see the first two paragraphs of [CKT, Section 10.3]).

Assume now that $F$ is unfoldable and let $E' \subseteq E$ be such that $F$ is a class-bijective factor of $E'$. Then clearly $[[E']] \subseteq [[E]]$ and, since $F$ is a class-bijective factor of $E'$, there is a canonical embedding of $[[F]]$ into $[[E']]$ and thus into $[[E]]$, so, by the definition of soficity, $F$ is sofic. 

The combination of Propositions 16.17, 16.19 gives then a new proof of the following result of Elek-Lippner (another proof is also given in [CKT, Section 10.3]).

**Corollary 16.20** (Elek-Lippner, [EL]). Every treeable equivalence relation is sofic.

**(E) Relative hyperfiniteness.** We consider here the following question:

Suppose $E$ is hyperfinite and generated by a non-atomic $\sigma$-subalgebra $\mathcal{A}$, i.e., $E$ is generated by a countable group of transformations that are $\mathcal{A}$-measurable (i.e., preserve $\mathcal{A}$). Can we find a single $\mathcal{A}$-measurable transformation that generates $E$, i.e., is $E$ hyperfinite relative to $\mathcal{A}$?

The answer is in general negative as the following example shows: Consider $(2^\mathbb{N}, \mu)$, where $\mu$ is the usual product measure, and the equivalence relation $E_0$ of eventual equality. Let $E = E_0 \times E_0$ be the product equivalence relation, let $\pi: 2^\mathbb{N} \times 2^\mathbb{N} \to 2^\mathbb{N}$ be the first projection and $\mathcal{A}$ the corresponding $\sigma$-algebra. Clearly $E$ is generated by $\mathcal{A}$. Suppose, towards a contradiction, that there is a $T$ which preserves $\mathcal{A}$ and generates $E$. Then $T$ sends vertical lines (i.e., sets of the form $\pi^{-1}(x)$) to vertical lines and $\hat{\pi}(T)$ generates $E_0$, so it is aperiodic, thus $T$ fixes no vertical line. But in every vertical line there are distinct $E$-inequivalent elements, so $T$ cannot generate $E$.

The following result provides the next possible answer.

**Theorem 16.21.** Let $E$ be hyperfinite and generated by a non-atomic $\sigma$-subalgebra $\mathcal{A}$. Then

(i) There are $T_1, T_2 \in [E]^\mathcal{A}$ that generate $E$.

(ii) If $E$ is ergodic, then there is $T \in [E]^\mathcal{A}$ that generates $E$ iff the factor corresponding to $\mathcal{A}$ is class-bijective.
Proof. (i) Let $\pi: X \to Y$ be the map associated to $\mathcal{A}$ and $F$ the corresponding factor equivalence relation on $Y$. Then, by Proposition 16.9, $F$ is hyperfinite. Say $F = E_S$, where $S \in [F]$. Let $T_1 \in [E]^{\mathcal{A}}$ be such that $\hat{\pi}(T_1) = S$ and let $E' = E_{T_1}$. Then by Proposition 16.2, $E = E' \vee E_{\pi}$. Clearly $E_{\pi}$ is generated by some $T_2 \in [E]^{\mathcal{A}}$, so $E$ is generated by $T_1, T_2$.

(ii) If the factor corresponding to $\mathcal{A}$ is class-bijective, then, since the factor equivalence relation $F$ is hyperfinite, clearly there is $T \in [E]^{\mathcal{A}}$ that generates $E$. Conversely, assume that there is $T \in [E]^{\mathcal{A}}$ that generates $E$ and, towards a contradiction, that $E_{\pi} \neq \text{id}$. Then for a positive measure set of $x$, there is $n \neq 0, n \in \mathbb{Z}$ such that $\pi(T^n(x)) = \pi(x)$. Now $\hat{\pi}(T) = S$ generates $F$ and $S^n(\pi(x)) = \pi(x)$, therefore $[\pi(x)]_{E_{\pi}}$ is finite. But $F$ is ergodic, so aperiodic, a contradiction. \quad \square

Ben Miller raised the following questions:

**Problem 16.22.** i) Let $E$ be hyperfinite and generated by a non-atomic $\sigma$-subalgebra $\mathcal{A}$. Is there an increasing sequence $E_0 \subseteq E_1 \subseteq \ldots$ of finite equivalence relations which are generated by $\mathcal{A}$ with $E = \cup_n E_n$?

ii) What if we assume the stronger hypothesis that $E = E_T$, for some $T \in [E]^{\mathcal{A}}$?

We have the following result which provides a weaker version of a positive answer to part i) of Problem 16.22 and a positive answer to part ii).

**Proposition 16.23.** i) Let $E$ be hyperfinite and generated by a non-atomic $\sigma$-subalgebra $\mathcal{A}$. Then there is an increasing sequence $E_0 \subseteq E_1 \subseteq \ldots$ of equivalence relations, which are generated by $\mathcal{A}$, with $E = \cup_n E_n$ and for each $n$ an increasing sequence $E_{n,0} \subseteq E_{n,1} \subseteq \ldots$ of finite equivalence relations which are generated by $\mathcal{A}$ such that $E_n = \cup_m E_{n,m}$.

In particular, $E$ is the limit (in the topology of $S(E)$) of a sequence of finite subequivalence relations which are generated by $\mathcal{A}$.

ii) If moreover $E = E_T$, for some $T \in [E]^{\mathcal{A}}$, then then there is an increasing sequence $E_0 \subseteq E_1 \subseteq \ldots$ of finite equivalence relations, which are generated by $\mathcal{A}$, with $E = \cup_n E_n$.

**Proof.** i) Consider the factor map $\pi$ associated with $\mathcal{A}$ and the factor equivalence relation $F$. Then $F$ is hyperfinite, by Proposition 16.9, so we can write it as $F = \cup_n F_n$, with $F_0 \subseteq F_1 \subseteq \ldots$ finite equivalence relations. Let also, by Proposition 16.17, $E' \subseteq$ be such that $F$ is a class-bijective factor of

104
\[ E' \text{ via } \pi \text{ and } E = E' \lor E_\pi. \] Let \[ x F'_n y \iff x E' y \& \pi(x) F_n \pi(y) \] and put \[ E_n = F'_n \lor E_\pi. \] Clearly \( E_n \) is generated by \( A \), increasing, and \( \bigcup_n E_n = E \).

Fix now \( n \) in order to define \( E_{n,m} \). Let \( B \) be a Borel selector for \( F_n \), i.e., a Borel set meeting every \( F_n \)-class in exactly one point. For each \( F_n \)-class \( C \) let \( y_C \) be the point of \( B \) in \( C \). Write also \( E_\pi = \bigcup_m E_{\pi,m} \), with \( E_{\pi,m} \) finite and increasing. Clearly each \( E_{\pi,m} \) is generated by \( A \). Define now \( E_{n,m} \) as follows:

Given \( x \) with \( \pi(x) = y_C \) and any \( y \in C \), there is a unique point \( \theta_y(x) \) such that \( \pi(\theta_y(x)) = y \) and \( x F'_n \theta_y(x) \). Define now the equivalence relation \( E_{\pi,n,m} \) by letting \( z E_{\pi,n,m} w \iff z E_\pi w \) and if \( C \) is the \( F_n \)-class of \( \pi(z) = \pi(w) = y \), then there are \( z', w' \) with \( z' E_{\pi,m} w' \) and \( \theta_y(z') = z, \theta_y(w') = w \).

Clearly \( E_{\pi,n,m} \) is finite and, since it is contained in \( E_\pi \), it is generated by \( A \). Finally let \( E_{n,m} = E_{\pi,n,m} \lor F'_n \). This works.

\( \text{ii) Let } \pi, F \text{ be as in i) and let } S = \hat{\pi}(T). \) Denote by \( P \) the Borel set which is the union of the set of finite \( F \)-classes and let \( Q \) be the complement of \( P \). Let \( A = \pi^{-1}(P), B = \pi^{-1}(Q) \). These are both in \( A \). Clearly \( F|Q \) is a class-bijective factor of \( E|B \), so since \( F|Q \) is the union an increasing sequence of \( A|B \), it is thus enough to show that \( E|A \) is the union an increasing sequence of \( A|A \). This can be done exactly as in the construction of the \( E_{n,m} \) from \( F_n \) in part i).

One can also ask if a kind of converse of the Problem 16.22, ii) is true: If there is an increasing sequence \( E_0 \subseteq E_1 \subseteq \ldots \) of finite equivalence relations, which are generated by \( A \), with \( E = \bigcup_n E_n \), is there \( T \in [E]^A \) such that \( E = E_T \)? The example given before Theorem 16.21 shows that this fails in general.

**Remark 16.24.** Let \( E \) be a measure preserving countable Borel equivalence relation on \((X, \mu)\). Then of course the following are equivalent:

a) \( E = E_T \) for some \( T \in \text{Aut}(X, \mu) \),

b) \( E \) is the union of an increasing sequence of finite Borel equivalence relations.

The preceding show that when relativized to a \( \sigma \)-subalgebra \( A \), a) implies b) but not vice versa.

**F Relative cost.** Let \( E \) be a countable measure preserving Borel equivalence relation on \((X, \mu)\) and let \( A \) be a non-atomic \( \sigma \)-subalgebra of
MALG such that $E$ is generated by $A$. Let $\pi: X \to Y$ be the associated to $A$ factor map and $F$ the factor equivalence relation. Define the relative to $A$ full pseudogroup of $E$, in symbols $[[E]]^A$, as the set of all partial Borel bijections $\theta \in [[E]], \theta: A \to B$, such that $A, B \in A$, and for any $A' \subseteq A, B' \subseteq B, A', B' \in A$, we have $\theta(A'), \theta^{-1}(B') \in A$. If $\theta \in [[E]]^A, \theta: A \to B$, and $A = \pi^{-1}(C), B = \pi^{-1}(D)$, then, as in Section 16, (A), we have an element $\hat{\pi}(\theta) \in [[F]]$ such that $\hat{\pi}(\theta): C \to D$ and $\hat{\pi}(\theta)(\pi(x)) = \pi(\theta(x))$, for $x \in A$. Moreover, as in the proof of Proposition 16.1, the map $\hat{\pi}: [[E]]^A \to [[F]]$ is surjective and preserves composition.

Next define the cost of $E$ relative to $A$ by

$$C^A(E) = \inf \{ \sum_{i \in I} \mu(A_i): \theta_i: A_i \to B_i \in [[E]]^A, (\theta_i)_{i \in I} \text{ generates } E \}$$

(where $I$ varies over countable index sets).

Clearly $C^A(E) \geq C(E)$. Also notice that if $(\theta_i)_{i \in I}$ generates $E$, then $(\hat{\pi}(\theta_i))_{i \in I}$ generates $F$, therefore $C^A(E) \geq C(F)$.

Below we say that an equivalence relation $E$ on $(X, \mu)$ is finitely generated if it is of the form $E = E_{T_1, \ldots, T_n}$, for some $T_1, \ldots, T_n \in \text{Aut}(X, \mu)$.

**Theorem 16.25.** Let $E$ be a countable measure preserving Borel equivalence relation on $(X, \mu)$ and let $A$ be a non-atomic $\sigma$-subalgebra of MALG that generates $E$. Let $\pi: (X, \mu) \to (Y, \nu)$ be the associated to $A$ factor map and $F$ the factor equivalence relation. If $F$ is aperiodic (e.g., if $E$ is ergodic) and $E_\pi$ is finitely generated, then $C^A(E) = C(F)$.

**Proof.** We have already seen that $C^A(E) \geq C(F)$. If $C(F) = \infty$, then $C^A(E) = C(F) = \infty$. So we can assume that $C(F) < \infty$. We will show then that $C^A(E) \leq C(F)$.

Let $\epsilon > 0$ and find a graphing $(\eta_i)_{i \in I}$ of $F$ (where $\eta_i \in [[F]]$) such that $\sum_i \nu(\text{dom}(\eta_i)) < C(F) + \epsilon$. Let $\theta_i \in [[E]]^A$ be such that $\hat{\pi}(\theta_i) = \eta_i$. Then $\sum_i \mu(\text{dom}(\theta_i)) < C(F) + \epsilon$.

Let $E' \subseteq E$ be the equivalence relation generated by $(\theta_i)_{i \in I}$. We claim that $E = E' \vee E_\pi$. Indeed let $xEy$. Then $\pi(x)F\pi(y)$, so there are $i_1, \ldots, i_n$ such that $\eta_{i_1}^{\pm 1} \circ \cdots \circ \eta_{i_n}^{\pm 1}(\pi(x)) = \pi(\theta_{i_1}^{\pm 1} \circ \cdots \circ \theta_{i_n}^{\pm 1}(x)) = \pi(y)$, so $\theta_{i_1}^{\pm 1} \circ \cdots \circ \theta_{i_n}^{\pm 1}(x)E_\pi y$.

Since $F$ is aperiodic, fix a Borel complete section $B$ of $F$ with $\nu(B) < \epsilon$, so that if $A = \pi^{-1}(B)$, then $\mu(A) < \epsilon$. Let

$$E_A = E_\pi | A \sqcup \text{id} | (X \setminus A).$$
Let \( E_\pi = E_{T_1, \ldots, T_n} \), for some \( T_1, \ldots, T_n \in \text{Aut}(X, \mu) \). Since \( A \) is \( R_\pi \)-invariant, so \( E_\pi \)-invariant, \( E_A \) is generated by \( T_1|A, \ldots, T_n|A \), which belong to \( [[E_A]]^A \subseteq [[E]]^A \) (note that \( T_1(C) = C \), for any \( C \in A \)).

We next claim that \( E = E' \lor E_A \). Indeed it is enough to show that \( E_\pi \subseteq E' \lor E_A \). Let \( x E_\pi y \). Since \( B \) is a complete section of \( F \), there are \( i_1, \ldots, i_n \) such that \( \eta_{i_1}^{\pm 1} \circ \cdots \circ \eta_{i_n}^{\pm 1}(\pi(x)) \in B \), so \( \theta_{i_1}^{\pm 1} \circ \cdots \circ \theta_{i_n}^{\pm 1}(x) \in A \). Also \( \theta_{i_1}^{\pm 1} \circ \cdots \circ \theta_{i_n}^{\pm 1}(x) E_A \theta_{i_1}^{\pm 1} \circ \cdots \circ \theta_{i_n}^{\pm 1}(y) \in A \), thus \( x E' \theta_{i_1}^{\pm 1} \circ \cdots \circ \theta_{i_n}^{\pm 1}(x) E_A \theta_{i_1}^{\pm 1} \circ \cdots \circ \theta_{i_n}^{\pm 1}(y) E' y \).

We now have that \( E \) is generated by the \( \theta_i, i \in I \), and \( T_1|A, \ldots, T_n|A \) which are all in \( [[E]]^A \) and the sum of the measure of their domains is \(< C(F) + (n + 1)\epsilon \), thus, letting \( \epsilon \to 0 \), we have that \( C^A(E) \leq C(F) \). □

We do not know if the hypothesis that \( E_\pi \) is finitely generated is needed in Theorem 16.25.

**Corollary 16.26.** Let \( E, A, \pi, F \) be as in Theorem 16.25. Then if \( E_\pi \) is hyperfinite, \( C^A(E) = C(F) \). In particular, if \( E \) is ergodic hyperfinite, then \( C^A(E) = 1 \).

Although for \( E \) ergodic hyperfinite there might not be a single automorphism \( T \in [[E]]^A \) that generates \( E \) (see Theorem 16.21), Corollary 16.26 shows that \( C^A(E) \) is still equal to 1.

We next consider the question of when the infimum in the definition of \( C^A(E) \) is attained.

**Theorem 16.27.** Let \( E, A, \pi, F \) be as in Theorem 16.25. Then

i) If \( \pi \) is class-bijective and \( F \) is treeable, the infimum in the definition of \( C^A(E) \) is attained.

ii) Conversely, if the infimum in the definition of \( C^A(E) \) is attained and \( F \) has finite cost, \( F \) is treeable and \( \pi \) is class-bijective.

**Proof.** i) Note that if \( (\eta_i) \) is a treeing of \( F \), which therefore attains the cost of \( F \) (Gaboriau, see, e.g., [KM, 27.10]), and \( \hat{\pi}(\theta_i) = \eta_i \), with \( \theta_i \in [[E]]^A \), then \( (\theta_i) \) attains \( C^A(E) = C(F) \).

ii) Assume now \( (\theta_i) \) attains \( C^A(E) = C(F) \). Then if \( \hat{\pi}(\theta_i) = \eta_i \), \( (\eta_i) \) generates \( F \) and attains the cost of \( F \), so it is a treeing of \( F \), since \( F \) has finite cost (Gaboriau, see, e.g., [KM, 19.1]). If now \( E_\pi \neq id \), towards a contradiction, let \( x E_\pi y, x \neq y \). Then there are \( i_1, \ldots, i_n \) such that \( \theta_{i_1}^{\pm 1} \circ \cdots \circ \theta_{i_n}^{\pm 1}(x) = y \), thus \( \eta_{i_1}^{\pm 1} \circ \cdots \circ \eta_{i_n}^{\pm 1}(\pi(x)) = \pi(x) = \pi(y) \), a contradiction. □
In particular, using also Proposition 16.9, if $E$ is ergodic hyperfinite, then the infimum in the definition of $C^A(E) = 1$ is attained iff $\pi$ is class-bijective.

Let $E$ be a countable measure preserving Borel equivalence relation. We define the **cost spectrum** of $E$, in symbols $CSp(E)$, as the set of all $C^A(E)$, where $A$ varies over all the non-atomic $\sigma$-subalgebras of $\text{MALG}$ such that $E$ is generated by $A$. (Thus $CSp(E) \subseteq [C(E), \infty]$.) Clearly the cost spectrum is an invariant of isomorphism among equivalence relations. It might therefore be interesting to study its structure.

For example, if $E$ is ergodic hyperfinite, then $CSp(E) = \{1\}$. Is it true that if $E$ is ergodic, non-hyperfinite but has cost 1, then $CSp(E) \neq \{1\}$? If in fact for every ergodic, non-hyperfinite $E$ of cost 1, one has an $A, \pi$ such that actually $E_\pi$ is finitely generated and $C^A(E) > 1$, then it follows that for every ergodic, non-hyperfinite $E$ there is a subequivalence relation induced by a free action of $\mathbb{F}_2$ (which answers positively [KM, 28.14]). Indeed if that is the case, every ergodic, non-hyperfinite $E$ would have a factor $F$ of cost $> 1$, so that by [KM, 28.8] it would have a subequivalence relation induced by a free action of $\mathbb{F}_2$, which then could be lifted to such an action of $\mathbb{F}_2$ whose corresponding equivalence relation is included in $E$.

It is actually easy, using Theorem 16.25, to construct examples of ergodic, non-hyperfinite $E$ of cost 1, whose cost spectrum contains any finite set of reals $> 1$. Given $1 < c_1 < \cdots < c_n$, simply take ergodic, finitely generated equivalence relations $E_1, \ldots, E_n$ with $C(E_i) = c_i$ (Gaboriau, see, e.g., [KM, page 125, line 3]) and let $E = E_1 \times \cdots \times E_n$. Then $E$ has cost 1 (Gaboriau, see, e.g., [KM, 24.9]) but, using Theorem 16.25 and considering the factors corresponding to the projection functions, we see that $CSp(E) \supseteq \{c_1, \ldots, c_n\}$.

**(G) Topological rank of relative full groups.** Recall that a **topological generator** of a topological group $\Gamma$ is a subset $\Gamma_0$ of $\Gamma$ such that the subgroup generated by $\Gamma_0$ is dense in $\Gamma$. The **topological rank** of $\Gamma$, denoted by $t(\Gamma)$, is the smallest cardinality of a topological generator of $\Gamma$. Thus if $\Gamma$ is Polish, then $t(\Gamma) \leq \aleph_0$. It is easy to see that if $\Gamma$ is a Polish group, $N \vartriangleleft \Gamma$ a closed normal subgroup and $H = \Gamma/N$, then $t(\Gamma) \leq t(N) + t(H)$. Indeed, if $N_0$ is a topological generator of $N$ and $H_0$ a topological generator of $H$, then choose for each coset in $H_0$ a representative and let $\hat{H}_0 \subseteq \Gamma$ consist of these representatives. Then $N_0 \cup \hat{H}_0$ is a topological generator for $\Gamma$.

Let now $E$ be a countable measure preserving Borel equivalence relation on $(X, \mu)$, let $A$ be a non-atomic $\sigma$-subalgebra of $\text{MALG}$, with associated map $\pi$, such that $E$ is generated by $A$, and let $F$ be the factor of $E$ determined
by $A$. Then we have that

$$t([F]) \leq t([E]^A) \leq t([F]) + t([E_\pi]).$$

If then $F, E_\pi$ are aperiodic, we have $t([F]), t([E_\pi]) = 2$ (see LeM, p. 263), so $t([E]^A) \leq 4$. We do not know if 4 here can be lowered to 2.
17 The space of graphs

Consider again a countable, measure preserving equivalence relation $E$ on $(X, \mu)$. Denote by $\text{Gr}(E)$ the set of all (simple, undirected) Borel graphs $G$ on $X$ such that $G \subseteq E$, where again we identify two such graphs if they agree a.e.

For any $G \in \text{Gr}(E)$ and $T \in [E]$, let again

$$A_{T,G} = \{x: (x, T(x)) \in G\}$$

and define the strong topology on $\text{Gr}(E)$ as the one generated by the maps

$$G \mapsto A_{T,G},$$

$$\text{Gr}(E) \to \text{MALG},$$

for $T \in [E]$.

Note that we have the obvious analog of Proposition 3.10 (in relation to a generating sequence for $E$) and the following analog of Lemma 3.11.

Lemma 17.1. Let $\Gamma$ be a group, $a: \Gamma \times X \to X$ an action of $\Gamma$ on a set $X$ and put $a(g, x) = g \cdot x$. Let $E_a$ be the induced equivalence relation on $X$ and let $G \subseteq E_a$ be a graph. For $g \in \Gamma$, let

$$A_{g,G} = \{x: (x, g \cdot x) \in G\}.$$

Then

1. $A_{1,G} = \emptyset$,
2. $A_{g,G} \subseteq g^{-1} \cdot A_{g^{-1},G}$,
3. $A_{h,G} \cap \text{Fix}(h^{-1}g) \subseteq A_{g,G}$,

where

$$\text{Fix}(p) = \{x: p \cdot x = x\}.$$

Conversely, if $(A_g)_{g \in \Gamma}$ is a family of sets satisfying 1.-2. above, then the relation

$$xGy \iff \exists g (g \cdot x = y \lor x \in A_g)$$

defines a graph contained in $E_a$ and if 3. also holds we have that $A_g = A_{g,G}$. 

110
Therefore the proofs in Section 3 show that this topology is Polish. We will simply call it the **topology** of $Gr(E)$. For this topology we have the following:

$$G_n \to G \iff \forall i (A_{T,G_n} \xrightarrow{\text{MALG}} A_{T,G})$$

$$\iff \forall T \in [E] (A_{T,G_n} \xrightarrow{\text{MALG}} A_{T,G})$$

$$\iff \forall \varphi \in ((E)) (A_{\varphi,G_n} \xrightarrow{\text{MALG}} A_{\varphi,G}),$$

where, as usual, $(T_i)_{i \in \mathbb{N}}$ generates $E$ and for $\varphi \in ((E)), A_{\varphi,G} = \{ x \in \text{dom}(\varphi): (x, \varphi(x)) \in G \}$. Again as in Section 3, we can also view $Gr(E)$ as a closed subspace of $\text{MALG}_E$ with the induced topology. Note also that if $G_0 \subseteq G_1 \subseteq \ldots, G = \bigcup_n G_n$, then $G_n \to G$ and similarly if $G_0 \supseteq G_1 \ldots, G = \bigcap_n G_n$.

One can also define the weak topology on $Gr(E)$ as the topology generated by the maps $G \mapsto \mu(A_{T,G}), Gr(E) \to [0,1]$, for $T \in [E]$. Anush Tserunyan pointed out that the proof of Theorem 3.14 shows that this topology coincides with the above (strong) topology. Indeed, let $G_n \to G$ in the weak topology and let $T \in [E]$ be an involution. Let $A = A_{T,G}$, which is $T$-invariant, and let $S \in [E]$ agree with $T$ on $A$ and be equal to the identity in its complement. Then $A_{S,G_n} \subseteq A$ (since $x \in A_{S,G_n} \implies x \neq S(x)$) and so $\mu(A \setminus A_{S,G_n}) \to 0$, since $A_{S,G} = A$. Also $A_{T,G} \setminus A_{T,G_n} = A \setminus A_{S,G_n}$, so $\mu(A_{T,G} \setminus A_{T,G_n}) \to 0$.

As in the proof of Theorem 3.14 this implies that $\mu(A_{T,G_n} \setminus A_{T,G}) \to 0$, so $A_{T,G_n} \xrightarrow{\text{MALG}} A_{T,G}$.

**Remark 17.2.** On the set of bounded degree graphs in $Gr(E)$ one can also define the metric

$$D(G, H) = M(G \triangle H) = \int |G(x) \triangle H(x)|d\mu(x)$$

(see Lovász [L, page 352]), where $M$ is the measure on $E$ defined in Section 3, (D), (1), and $G(x) = \{ y: (x, y) \in G \}$ is the set of neighbors of $x$ in $G$. This gives rise to another topology on this set of graphs, for which is easy to check that it is at least as strong as the relative topology inherited from $Gr(E)$ (i.e., contains the relative topology). However, even for graphs of degree at most 2, it is easy to see that it may be actually strictly stronger. For example, take $E$ to be the equivalence relation generated by a free, measure preserving action of the free group $\mathbb{F}_\infty$, with infinitely many generators $a_0, a_1, \ldots$. Let
$G_n$ be the graph induced by the action of $a_n$, let $\mathbb{F}_\infty = \{g_0, g_1, \ldots\}$ and put $T_i(x) = g_i \cdot x$. Then $A_{T_i,G_n} = X$, if $g_i = a_n$, while $A_{T_i,G_n} = \emptyset$, if $g_i \neq a_n$. Thus $G_n$ converges to the empty graph in $Gr(E)$ but it is discrete in the metric $D$.

However if we consider the set of all $d$-regular graphs, for fixed $d \geq 2$, the $D$-topology on that set agrees with its relative topology from $Gr(E)$. Indeed assume that $G_n, G$ are $d$-regular and $G_n \to G$. Let $\varphi_1, \ldots, \varphi_d \in (\{E\})$ be such that for each $x$, $\varphi_1(x), \ldots, \varphi_d(x)$ are exactly the $G$-neighbors of $x$. Then for each $i \leq d$, $\mu(A_{\varphi_i,G_n}) \to \mu(A_{\varphi_i,G}) = 1$. So given $\epsilon > 0$, find $N$ large enough so that for $n \geq N$, $\mu(A_{\varphi_i,G_n}) > 1 - \frac{\epsilon}{d}$. Since the $\varphi_1(x), \ldots, \varphi_d(x)$ are distinct and $G_n$ is $d$-regular, it follows that for $x \in \bigcap_{i \leq d} A_{\varphi_i,G_n}$, we have $(G_n)(x) = G(x)$ and thus $D(G_n, G) \leq 2d\epsilon$, i.e., $D(G_n, G) \to 0$.

We also have the following analog of Theorem 4.1.

**Theorem 17.3.** Let $G_n, G \in Gr(E)$ and $G_n \to G$. Then for each $i$, there is an increasing sequence $n_0^{(i)} < n_1^{(i)} < \ldots$, so that $(n_m^{(i)})_{m \in \mathbb{N}}$ is a subsequence of $(n_m^{(i)})_{m \in \mathbb{N}}$ and

$$G = \bigcup_m \bigcap_{k \geq m} G_{n_k^{(m)}}.$$

**Proof.** Let $(\varphi_i)_{i \in \mathbb{N}}$ be a sequence in $[[E]]$ such that $(x, y) \in G \iff \exists i(\varphi_i(x) = y)$. Then repeat the proof of Theorem 4.1 to define $(n_m^{(i)})_{m \in \mathbb{N}}$ and show that $G \subseteq \bigcup_m \bigcap_{k \geq m} G_{n_k^{(m)}}$. For the converse again repeat the proof of Theorem 4.1 by showing that if $H = \bigcup_m \bigcap_{k \geq m} G_{n_k^{(m)}}$ and $(\psi_i)_{i \in \mathbb{N}}$ is a sequence in $[[E]]$ such that $(x, y) \in H \iff \exists i(\psi_i(x) = y)$, then for $x \in \text{dom}(\psi_i)$, $(x, \psi_i(x)) \in G$. \hfill $\Box$

For $G \subseteq Gr(E)$ we define $G_{\uparrow}$ as in the case of equivalence relations. Then we have:

**Theorem 17.4.** If $G \subseteq Gr(E)$ is closed under finite intersections, then $\overline{G} = (G_{\uparrow})_{\uparrow}$. In particular, if $G$ is hereditary, $\overline{G} = G_{\uparrow}$.

A locally countable Borel graph $G$ on $X$ is $(\mu)$-**measure preserving** if any partial Borel isomorphism $\varphi: A \to B$ such that $\text{graph}(\varphi) \subseteq G$ is measure preserving. This is equivalent to saying that the equivalence relation generated by $G$ (i.e., the equivalence relation whose equivalence classes are the connected components of $G$) is measure preserving. Denote by $\mathcal{GR}$ the

112
set of all Borel locally countable, measure preserving graphs on \((X, \mu)\), where as usual we identify two such graphs if they agree a.e. Then \(Gr(E) = \{ G \in \mathcal{GR}: G \subseteq E \}\) and \(\mathcal{GR} = \bigcup_{E \in \mathcal{E}} Gr(E)\). As in Theorem 5.1, we can see that if \(E \subseteq F\), then \(Gr(E)\) is a closed subset of \(Gr(F)\) and the topology of \(Gr(E)\) is the relative topology it inherits form \(Gr(F)\). Thus, as in Section 5, we can define the topology on \(\mathcal{GR}\) which is the topological union of the topologies on \(Gr(E), E \in \mathcal{E}\).

**Remark 17.5.** As a final comment, we mention that ultraproducts of graphs can be defined as in Section 15 using Lemma 17.1. Also the uniform topology on \(Gr(E)\) can be defined as in Section 3, (F).
18 More complexity calculations

For each \( G \in Gr(E) \), let \( G^* \in S(E) \) be the equivalence relation generated by \( G \). The argument in the paragraph preceding Proposition 3.28 shows that the operation \( G \in Gr(E) \mapsto G^* \in S(E) \) is not continuous. Indeed, in the notation used there, we can take \( G_n = F_n \setminus id \) and \( G = F \setminus id \). Then \( H_n = G_n \cup G \) is decreasing and \( \bigcap_n H_n = G \), so \( H_n \to G \), while \( H_n^* = E_S \) and \( G^* = E_{S^3} \). By a proof similar to that of Proposition 3.28 we also have the following:

**Proposition 18.1.** The map \( Gr(E) \ni G \mapsto G^* \in S(E) \) is of Baire class 1.

We call \( G \in Gr(E) \) a **graphing** of \( E \) is \( G^* = E \).

**Theorem 18.2.** The set \( \{ G \in Gr(E) : G \text{ is a graphing of } E \} \) is \( G_\delta \) in \( Gr(E) \).
If \( E \) is aperiodic, it is also dense in \( Gr(E) \).

*Proof.* That it is \( G_\delta \) follows from the preceding proposition, since \( G \) is a graphing of \( E \) iff \( G^* = E \).

Assume now \( E \) is aperiodic in order to show that \( \{ G : G \text{ is a graphing of } E \} \) is dense in \( Gr(E) \). A typical basic open set in \( Gr(E) \) has the form

\[
U_{G_0,T_1,\ldots,T_n,\epsilon} = \{ G \in Gr(E) : \forall 1 \leq i \leq n \ (\mu(A_{T_i,G} \Delta A_{T_i,G_0}) < \epsilon) \},
\]

where \( G_0 \in Gr(E) \), \( T_1, \ldots, T_n \in [E] \) and \( \epsilon > 0 \). We will show that any such set contains a graphing of \( E \). Since \( E \) is aperiodic, let \( S_1, S_2, \ldots \in [E] \) be aperiodic with \( E_{S_1, S_2, \ldots} = E \) (see [K, 8.5]). For each \( 1 \leq i \leq n, 1 \leq j < \infty, k \in \mathbb{Z} \), let \( A_{i,j,k} = \{ x : T_i(x) = S_j^k(x) \} \). For fixed \( i, j, k \), the sets \( \{ A_{i,j,k} \}_{k=1}^\infty \) are pairwise disjoint, so for any \( \delta > 0 \) there is \( N_0(i,j,\delta) \) such that

\[
\mu(\bigcup_{|k| \geq N_0(i,j,\delta)} A_{i,j,k}) < \delta.
\]

Let \( M_0(j,\delta) = \max_{1 \leq i \leq n} N_0(i,j,\delta) \).

Now define for each \( 1 \leq j < \infty \) a graph \( G_j \in Gr(E) \) as follows:

\[
(x, y) \in G_j \iff y = S_j^{\pm k}(x) \lor y = S_j^{\pm (k+1)}(x),
\]

where \( k = M_0(j,\delta_j) \) with \( \delta_j = \frac{\epsilon}{2^{j+1}} \). Let \( G = G_0 \cup \bigcup_{j=1}^\infty G_j \). We claim that \( G \in U_{G_0,T_1,\ldots,T_n,\epsilon} \) and \( G \) is a graphing of \( E \).

1. \( G \in U_{G_0,T_1,\ldots,T_n,\epsilon} \): Let \( 1 \leq i \leq n \). Then \( A_{T_i,G} = A_{T_i,G_0} \cup \bigcup_{j=1}^\infty A_{T_i,G_j} \). If \( x \in A_{T_i,G_j} \), then there is \( |k| \geq M_0(j,\delta_j) \), with \( T_i(x) = S_j^k(x) \), so \( x \in
\[ \bigcup_{|k| \geq N_0(i,j,\delta_j)} A_{i,j,k}, \] therefore \( \mu(A_{T_i,G}) < \delta_j \) and so

\[
\mu(A_{T_i,G} \Delta A_{T_i,G_0}) \leq \mu\left( \bigcup_{j=1}^{\infty} A_{T_i,G_j} \right) 
\leq \sum_{j=1}^{\infty} \delta_j = \frac{\epsilon}{2} < \epsilon.
\]

(2) \( G^* = E \): It is enough to show that for \( x \in X \) and \( 1 \leq j < \infty, (x, S_j(x)) \in G_j^* \). Let \( k = M_0(j, \delta_j) \). Then \( (x, S_j^{k+1}(x)) \in G_j \) and \( (S_j(x), S_j^{k+1}(x)) \in G_j \), so \( (x, S_j(x)) \in G_j^* \).

As in Section 7, if \( G \subseteq GR \) is a class of measure preserving locally countable Borel graphs and \( E \in E \), we let

\[ G_E = G \cap Gr(E). \]

In particular, \( GR_E = Gr(E) \).

We call \( G \in GR \) **acyclic** if for (almost) all \( x \), there is no sequence \( x = x_0, x_1, x_2, \ldots, x_n \), with \( n \geq 2 \), of distinct points with \( (x_0, x_1) \in G, (x_1, x_2) \in G, \ldots, (x_{n-1}, x_n) \in G, (x_n, x_0) \in G \). We denote by \( TR \) the class of acyclic graphs.

**Theorem 18.3.** The set \( TR_E = \{ G \in Gr(E) : G \text{ is acyclic} \} \) is closed in \( Gr(E) \).

**Proof.** This follows from Theorem 17.4, but here is also a direct proof. Note that \( G \) is not acyclic iff \( \exists n \geq 2 \exists T_1, T_2, \ldots, T_n \in [E] \) \( \mu(\{ x : \text{For all } 0 \leq i < j \leq n(x \notin \text{Fix}(T_i^{-1}T_j)) \& \forall i < n(x \in A_{T_i,T_{i+1},G} \& x \in A_{T_n,T_0,G})\}) > 0 \) where \( T_0 = id \) and for \( T \in [E], \text{Fix}(T) = \{ x : T(x) = x \} \), so

\[
\{ G : G \text{ is not acyclic} \} = \bigcup_{n \geq 2} \bigcup_{T_1, \ldots, T_n \in [E]} \{ G : \mu(\bigcap_{0 \leq i < j \leq n} (X \setminus \text{Fix}(T_i^{-1}T_j))) \cap \bigcap_{i < n} A_{T_i,T_{i+1},G} \cap A_{T_n,T_0,G} > 0 \},
\]

which is clearly open. \( \square \)

A **treeing** \( G \) of \( E \) is an acyclic graphing of \( E \).
Corollary 18.4. The set \( \{ G \in \text{Gr}(E) : G \text{ is a treeing of } E \} \) is a \( G_\delta \) set in \( \text{Gr}(E) \).

Similarly we define what it means to say that \( G \in \text{Gr}(E) \) is a graphing of \( F \in \text{S}(E) \) (namely \( G^* = F \)) or a treeing of \( F \). We thus have:

Corollary 18.5. The set \( \{ (G,F) : G \text{ is a graphing of } F \} \) is \( G_\delta \) in \( \text{Gr}(E) \times \text{S}(E) \). Similarly for \( \{ (G,F) : G \text{ is a treeing of } F \} \). In particular \( \{ F \in \text{S}(E) : F \text{ is treeable} \} \) is analytic in \( \text{S}(E) \).

Proof. Let \( \{ U_n \} \) be a countable open basis for \( \text{S}(E) \). Then \( G^* = F \iff \forall n (G^* \in U_n \Rightarrow F \in U_n) \).

The following is a basic open problem.

Problem 18.6. Is \( \{ F \in \text{S}(E) : F \text{ is treeable} \} \) Borel? Is there a Borel function \( f : \{ F \in \text{S}(E) : F \text{ is treeable} \} \to \text{Gr}(E) \) such that \( f(F) \) is a treeing of \( F \), if \( F \) is treeable.

We next have the following fact, where for each \( d \geq 1 \), we let \( \mathcal{GR}_d = \{ G \in \mathcal{GR} : G \text{ has degree } \leq d \} \).

Proposition 18.7. The set \( \mathcal{GR}_{d,E} = \{ G \in \text{Gr}(E) : G \text{ has degree } \leq d \} \) is closed in \( \text{Gr}(E) \), for any \( d \geq 1 \).

Proof. Again this follows from Theorem 17.4, but we can also give a direct proof. Note that

\[
\text{Gr}(E) \setminus \{ G : \text{has degree } \leq d \} = \bigcup_{T_1,\ldots,T_{d+1} \in [E]} \{ G : \\
\mu( \bigcap_{1 \leq i < j \leq d+1} (X \setminus \text{Fix}(T_i^{-1}T_j)) \\
\cap \bigcap_{1 \leq i \leq d+1} A_{T_i,G} ) > 0 \}.
\]

Now let \( \mathcal{BDG} = \{ G \in \mathcal{GR} : G \text{ has bounded degree} \} \).

Corollary 18.8. The set \( \mathcal{BDG}_E = \{ G \in \text{Gr}(E) : G \text{ has bounded degree} \} \) is dense \( F_\sigma \) in \( \text{Gr}(E) \). Moreover, if \( E \) is aperiodic, then its complement is dense in \( \text{Gr}(E) \), so \( \mathcal{BDG}_E \) is in \( F_\sigma \setminus G_\delta \).
Proof. It is clear that $\mathcal{BDG}_E$ is $F_\sigma$ by Proposition 18.7. Density is also easy, since if $(T_n)$ is a uniquely generating sequence of Borel involutions for $E$, then for any $G \in \text{Gr}(E)$, if $G_n = G \cap \bigcup_{k \leq n} \text{graph}(T_k)$, then $G_n \to G$. Finally if $E$ is aperiodic, put $H_n = G \cup \bigcup_{k \geq n} \{(x, y) : x \neq y \& T_k(x) = y\}$. Then $H_n \to G$. \hfill \Box

We also have, letting $\mathcal{IDG} = \{G \in \mathcal{GR} : G \text{ has infinite degree}\}$:

**Proposition 18.9.** The set $\mathcal{IDG}_E = \{G \in \text{Gr}(E) : G \text{ has infinite degree}\}$ is $G_\delta$ in $\text{Gr}(E)$ and, if $E$ is aperiodic, it is dense in $\text{Gr}(E)$.

**Proof.** Let $(T_i)_{i \in \mathbb{N}}$ be a generating sequence for $E$. Let also for each $n$, $D_n = \{T_0, \ldots, T_{n-1}\}$. Finally let $\text{deg}_G(x)$ be the degree of $x$ in $G$. We have

$$\{x : \text{deg}_G(x) \geq d\} = \bigcup_{n} \bigcup_{S_1 \ldots S_d \in D_n} \left[ \bigcap_{1 \leq i < j \leq d} (X \setminus \text{Fix}(S_i^{-1}S_j)) \cap \bigcap_{1 \leq i \leq d} A_{S_i, G} \right],$$

and

$$G \in \mathcal{IDG}_E \iff \forall d \geq 1 \forall \epsilon \in \mathbb{Q}^+ (\mu(\{x : \text{deg}_G(x) \geq d\}) > 1 - \epsilon)$$

therefore $G \in \mathcal{IDG}_E$ iff the following holds: $\forall d \geq 1 \forall \epsilon \in \mathbb{Q}^+ \exists n$

$$\mu\left(\bigcup_{S_1 \ldots S_d \in D_n} \left[ \bigcap_{1 \leq i < j \leq d} (X \setminus \text{Fix}(S_i^{-1}S_j)) \cap \bigcap_{1 \leq i \leq d} A_{S_i, G} \right]\right) > 1 - \epsilon$$

so $\mathcal{IDG}_E$ is in $G_\delta$.

Density in case of aperiodic $E$ follows from the proof of Corollary 18.8, since the graphs $H_n$ defined there are in $\mathcal{IDG}_E$. \hfill \Box

Finally we have, letting $\mathcal{LFG} = \{G \in \mathcal{GR} : G \text{ is locally finite}\}$:

**Proposition 18.10.** The set $\mathcal{LFG}_E = \{G \in \text{Gr}(E) : G \text{ is locally finite}\}$ is $F_\sigma \delta$ in $\text{Gr}(E)$. Both $\mathcal{LFG}_E$ and its complement are dense in $\text{Gr}(E)$, if $E$ is aperiodic. Moreover if $E$ is ergodic, $\mathcal{LFG}_E$ is in $F_\sigma \delta \setminus G_\delta \sigma$. 

117
Proof. Using the notation of the proof of 18.9 we have

\[ G \text{ is locally finite } \iff \forall \epsilon \in \mathbb{Q}^+ \exists d \in \mathbb{N} \quad \mu(\{x: \text{deg}_G(x) < d\}) \geq 1 - \epsilon, \]

so it is enough to show that for each fixed \( d \in \mathbb{N} \),

\[ \{G: \mu(\{x: \text{deg}(x) < d\}) \geq 1 - \epsilon\} \]

is closed. Note that

\[ \{x: \text{deg}_G(x) < d\} = \bigcap_n \bigcap_{S_1, \ldots, S_d \in \mathcal{D}_n} \left[ \bigcup_{1 \leq i < j \leq d} \text{Fix}(S_i^{-1}S_j) \cup \bigcup_{1 \leq i \leq d} (X \setminus A_{S_i,G}) \right], \]

and

\[ \mu(\{x: \text{deg}_G(x) < d\}) \geq 1 - \epsilon \iff \forall n \left[ \mu\left( \bigcap_{S_n, \ldots, S_d \in \mathcal{D}_n} \left[ \bigcup_{1 \leq i < j \leq d} \text{Fix}(S_i^{-1}S_j) \cup \bigcup_{1 \leq i \leq d} (X \setminus A_{S_i,G}) \right] \right) \geq 1 - \epsilon \right], \]

which is clearly a closed condition on \( G \).

By Corollary 18.8 and Proposition 18.9 both \( \mathcal{LFG}_E \) and its complement are dense in \( Gr(E) \), if \( E \) is aperiodic.

Assume now that \( E \) is ergodic. Then the argument in the proof of Theorem 7.7 shows that \( \mathcal{LFG}_E \) is not in \( G_{\delta} \).

Denote by \( C(G) \) the cost of \( G \), i.e., \( C(G) = \frac{1}{2} \int \text{deg}_G(x)d\mu(x) \in [0, \infty] \).

**Proposition 18.11.** The function \( G \in Gr(E) \mapsto C(G) \) is lower semicontinuous, i.e., for every \( r \in \mathbb{R} \), \( \{G \in Gr(E): C(G) > r\} \) is open. In particular, \( \{G \in Gr(E): C(G) = \infty\} \) is \( G_{\delta} \).

**Proof.** We will show that for each \( r \in \mathbb{R} \), \( \{G \in Gr(E): C(G) \leq r\} \) is closed. This follows from Theorem 17.4, since \( G \subseteq H \Rightarrow C(G) \leq C(H) \) and \( G_0 \subseteq G_1 \subseteq \cdots \Rightarrow C(\bigcup_n G_n) = \lim_{n \to \infty} C(G_n) \).
Theorem 18.12. If $E$ is aperiodic, the set $\{G \in Gr(E) : C(G) = \infty\}$ is dense and therefore the generic $G \in Gr(E)$ is a graphing of $E$ of infinite cost.

Proof. Recall that $E$ admits a measure $M$ defined by

$$M(A) = \int |A_x| \, d\mu(x) = \int |A^y| \, d\mu(y),$$

for Borel $A \subseteq E$. Moreover for $G \in Gr(E)$, $C(G) = \frac{1}{2} M(G)$. Since $E$ is aperiodic $M(E) = \infty$ and since $E = \bigcup_n \text{graph}(f_n)$ for Borel functions $f_n : X \to X, M$ is $\sigma$-finite.

Let $G \in Gr(E)$ in order to show that there is a sequence $G_n \in Gr(E)$ with $C(G_n) = \infty$ and $G_n \to G$. We can assume of course that $C(G) < \infty$.

Write $E \setminus G = \bigsqcup_n A_n$, with $M(A_n) < \infty$. Let $B_n = G \cup \bigsqcup_{m \geq n} A_m$, so that $M(B_n) = \infty, B_0 \supseteq B_1 \supseteq \ldots \cap_n B_n = G$. Let $G_n = (B_n \cup B'_n) \setminus \{(x, x) : x \in X\}$, where $B'_n = \{(x, y) \in E : (y, x) \in B_n\}$. Then $G_n \in Gr(E), M(G_n) = \infty, G_0 \supseteq G_1 \supseteq G_2, \ldots$ and moreover $\cap_n G_n = G$. Because if $(x, y) \in \cap_n G_n$, then $x \neq y$, and for infinitely many $n$, $(x, y) \in B_n$ or for infinitely many $n$, $(x, y) \in B'_n$, i.e., $(y, x) \in B_n$, so $(x, y) \in G$. Then $G_n \to G$ and we are done.

It is also clear that the $F_\delta$ set $\{G \in Gr(E) : C(G) = \infty\}$ is dense, since every $G$ can be written as the union of an increasing sequence $G_n$ with $C(G_n) = \frac{1}{2} M(G_n) < \infty$. In particular, it follows that $\{G \in Gr(E) : C(G) = \infty\}$ is in $F_\delta \setminus G_\delta$.

Finally we have the following result concerning locally finite graphings of equivalence relations (see [JKL, Theorem 3.12]).

Proposition 18.13. There is a Borel function $\Lambda : S(E) \to Gr(E)$ such that for any $F \in S(E), \Lambda(F)$ is a locally finite graphing of $F$.

Proof. Use Proposition 3.17 and [JKL, proof of Theorem 3.12].
19 Treeability

In view of the proof of Theorem 13.1 (in the ergodic case), one can try to approach Problem 18.6 by first trying to show an analog of Sublemma 13.3 for treeability. Recall that, by Theorem 18.3, the set
\[ \mathcal{T}R_E = \{ G \in Gr(E) : G \text{ is acyclic} \} \]
is closed in \( Gr(E) \). By Corollary 18.4, the set
\[ \text{Treeing}(E) = \{ G \in \mathcal{T}R_E : G \text{ is a treeing of } E \} \]
is \( \mathcal{G}_\delta \) in \( \mathcal{T}R_E \). If \( E \) is not treeable, clearly this set is empty.

Problem 19.1. If \( E \) is ergodic, treeable, is \( \text{Treeing}(E) \) dense in \( \mathcal{T}R_E \)?

We first note the following:

Proposition 19.2. If there is \( G \in \mathcal{T}R_E \) with \( C(G) = \infty \), then \( \{ G \in \mathcal{T}R_E : C(G) = \infty \} \) is dense in \( \mathcal{T}R_E \).

Proof. The proof is analogous to that of Theorem 18.12. Let \( G \in \mathcal{T}R_E \) with \( C(G) < \infty \). Fix \( G_\infty \in \mathcal{T}R_E \) with \( C(G_\infty) = \infty \). Let \( S = G_\infty \setminus G \), so that \( C(G) = \infty \). Write \( S = \bigsqcup_n G_n \), with \( G_n \in \mathcal{T}R_E \) and \( C(G_n) < \infty \). Let \( H_n = G \sqcup \bigcup_{m \geq n} G_m \). Then \( C(H_n) = \infty \) and \( H_0 \supseteq H_1 \supseteq \ldots \cap_n H_n = G \), so \( H_n \to G \).

Recall that \( C(E) \) denotes the cost of the equivalence relation \( E \).

Proposition 19.3. Let \( E \) be ergodic with \( C(E) > 1 \). Then the set \( \{ G \in \mathcal{T}R_E : C(G) = \infty \} \) is dense \( \mathcal{G}_\delta \) in \( \mathcal{T}R_E \). In particular if \( 1 < C(E) < \infty \), then the generic \( G \in \mathcal{T}R_E \) is not a treeing of \( E \).

Proof. By the proof of [KM, 28.8], since \( C(E) > 1 \), there is a free action of \( \mathbb{F}_2 \) on \( X \) whose equivalence relation is contained in \( E \). Since \( \mathbb{F}_\infty \subseteq \mathbb{F}_2 \), this gives a \( G \in \mathcal{T}R_E \) with \( C(G) = \infty \).

Thus Problem 19.1 has a negative answer if \( C(E) < \infty \), but \( E \) is not hyperfinite (in which case \( C(E) > 1 \)). We next show that it has a positive answer if \( E \) is hyperfinite.

Proposition 19.4. Let \( E \) be ergodic, hyperfinite. Then \( \text{Treeing}(E) \) is dense in \( \mathcal{T}R_E \) and thus the generic \( G \in \mathcal{T}R_E \) is a treeing of \( E \).
**Proof.** Let \( G_0 \in \mathcal{TR}_E \), \( T_1, \ldots, T_n \in [E] \) and \( \epsilon > 0 \). We need to find \( G \in \mathcal{TR}_E \) which is a treeing of \( E \) and \( \forall 1 \leq i \leq n, (\mu(A_{T_i,G}D_iA_{T_i,G_0}) < \epsilon) \).

First we claim that we can assume that \( G_0^* \) is a finite equivalence relation. Indeed \( G_0^* \subseteq E \) is hyperfinite, so we can write \( G_0^* = \bigcup_{n=1}^\infty E_n \), where \( E_i \subseteq E_2 \subseteq \ldots \) and each \( E_n \) is finite. Let \( G_i = E_i \cap G_0 \), for \( i = 1, 2, \ldots \) Then \( G_i \in \mathcal{TR}_E \), \( G_i \subseteq E_i \) is finite, \( G_1 \subseteq G_2 \subseteq \ldots \) and \( G_0 = \bigcup_{n=1}^\infty G_n \), so \( G_n \rightarrow G_0 \).

Since \( E \) is aperiodic, it is clear that every \( E \)-class contains infinitely many \( G_0^* \)-classes. Let \( Y \subseteq X \) be a Borel transversal for \( G_0^* \). Clearly \( \mu(Y) > 0 \) and \( Y \) meets every \( E \)-class infinitely often.

We claim that there is \( T \in [E|Y] \) such that \( T \) generates \( E|Y \) and moreover \( \mu(\{ x \in Y : \exists 1 \leq i \leq n (T(x) = T_{i}^{\pm 1}(x)) \}) < \epsilon \). Granting this, let \( G \in Gr(E) \) be defined by

\[(x, y) \in G \iff (x, y) \in G_0 \vee [x, y \in Y \& y = T_{i}^{\pm 1}(x)]\]

Then clearly \( G \in \mathcal{TR}_E \) and \( G^* = E \). Moreover for any \( 1 \leq i \leq n \),

\[A_{T_i,G} = A_{T_i,G_0} \cup \{ x \in Y : T_i(x) = T_{i}^{\pm 1}(x) \},\]

thus

\[\mu(A_{T_i,G}D_iA_{T_i,G_0}) = \mu(\{ x \in Y : T_i(x) = T_{i}^{\pm 1}(x) \}) < \epsilon.\]

It remains to prove the claim. It is enough to show that there is an aperiodic \( S \in [E|Y] \) such that for each \( 1 \leq i \leq n \), \( \mu(\{ x \in Y : S(x) = T_{i}^{\pm 1}(x) \}) < \frac{\epsilon}{2n} \), so that \( \mu(\{ x \in Y : \exists 1 \leq i \leq n (S(x) = T_{i}^{\pm 1}(x)) \}) < \frac{\epsilon}{2} \), because then applying the Conjugacy Lemma (see, [K, 3.4]) to \([E|Y] \), we can find \( T \in [E|Y] \) which generates \( E|Y \) and \( \mu(\{ x \in Y : S(x) \neq T(x) \}) < \frac{\epsilon}{2} \) and thus

\[\mu(\{ x \in Y : \exists 1 \leq i \leq n (T(x) = T_{i}^{\pm 1}(x)) \}) < \epsilon.\]

To find \( S \), let \( S_0 \in [E|Y] \) be aperiodic and generate \( E|Y \). Let for each \( 1 \leq i \leq n \),

\[Z_i = \{ x \in Y : T_{i}^{\pm 1}(x) \in Y \}.\]

If \( x \in Z_i \), then \( (x, T_{i}^{\pm 1}(x)) \in E|Y \), so there is some \( m \in \mathbb{Z} \) with \( T_{i}^{\pm 1}(x) = S_0^m(x) \). Let for \( N \in \mathbb{N} \),

\[Z_{N,i} = \{ x \in Y : \exists |m| \leq N(T_{i}^{\pm 1}(x) = S_0^m(x)) \}.\]
Then \( Z_{0,i} \subseteq Z_{1,i} \subseteq \ldots \) and \( \bigcup_{N} Z_{N,i} = Z_{i} \). So find \( N_{0} \) large enough with
\[
\mu(Z_{i} \setminus Z_{N_{0},i}) < \frac{\epsilon}{2n}.
\]

Let \( S = S_{0}^{N_{0}+1} \in [E|Y] \), which is clearly aperiodic. If \( x \in Y \) and \( S(x) = T_{i}^{\pm 1}(x) \), then \( T_{i}^{\pm 1}(x) = S_{0}^{N_{0}+1}(x) \), so \( x \in Z_{i} \setminus Z_{N_{0},i} \), thus \( \mu(\{x \in Y : S(x) = T_{i}^{\pm 1}(x)\}) \leq \mu(Z \setminus Z_{N_{0}}) < \frac{\epsilon}{2n} \), and the proof is complete. \( \square \)

**Corollary 19.5.** Let \( E \) be ergodic, with finite cost. Then \( E \) is hyperfinite iff the generic \( G \in \mathcal{TR}_{E} \) is a treeing of \( E \).

Thus the only remaining open case of Problem 19.1 is when \( C(E) = \infty \).

There is actually a strengthening of Proposition 19.4, proved by Anush Tserunyan, with a simpler proof than the above. We will use below the following notation and terminology.

We call \( G \in Gr(E) \) **finite, smooth, hyperfinite** if \( G^{*} \) is, resp., finite, smooth, hyperfinite. Let \( \mathcal{FTR}_{E} \), \( \mathcal{STR}_{E} \) and \( \mathcal{HTR}_{E} \) denote, resp., the set of finite, smooth, hyperfinite \( G \in \mathcal{TR}_{E} \). Note that by Theorem 17.4, \( \mathcal{HTR}_{E} \) is closed and \( \mathcal{FTR}_{E} = \mathcal{STR}_{E} = \mathcal{HTR}_{E} \).

**Proposition 19.6** (A. Tserunyan). Let \( E \) be aperiodic and treeable. For any \( G_{0} \in \mathcal{STR}_{E} \) and \( T_{1}, \ldots, T_{m} \in [E] \), there is a treeing \( G \supseteq G_{0} \) of \( E \) such that \( A_{T_{i},G} = A_{T_{i},G_{0}} \), for all \( i \).

**Proof.** Let \( Y \) be a transversal for \( G_{0}^{*} \) and take a group \( \Gamma = \{g_{n}\}_{n \in \mathbb{N}} \subseteq [E] \) that generates \( E \). We first handle two special cases and the general case will follow from them.

**Case 1:** \( [E : G_{0}^{*}] < \infty \). Then \( E|Y \) is a finite equivalence relation and hence there is a Borel selector \( s : Y \to Y \) for \( E|Y \) such that \([s(y)]G_{0}^{*}\) is infinite for all \( y \in Y \) (such \( s \) exists because \( E \) is aperiodic). Now define a function \( g : Y \setminus s(Y) \to X \) by \( g(y) = g_{n}(y) \), where \( n \) is the least such that \( g_{n}(y) \in [s(y)]G_{0}^{*} \) and for any \( i = 1, \ldots, m \), \( g_{n}(y) \neq T_{i}(y) \) and \( T_{i}(g_{n}(y)) \neq y \) (such \( n \) exists since \([s(y)]G_{0}^{*}\) is infinite). Finally, put \( G = \{(y, g(y)), (g(y), y) : y \in Y \setminus s(Y)\} \cup G_{0} \). It is straightforward to check that \( G \) is a treeing of \( E \) satisfying the condition of the proposition.

**Case 2:** \( [E : G_{0}^{*}] = \infty \). Let \( H \) be the graph on \( Y \) generated by \( T_{1}, \ldots, T_{m} \), i.e. for \( x, y \in Y \),
\[
xHy \iff x \neq y \text{ and } \exists i(T_{i}(x) = y \text{ or } T_{i}(y) = x).
\]
Since $H$ is locally finite, it admits a Borel countable coloring (actually a finite coloring), and thus there is a maximal independent Borel subset $Z$. For every $E$-class $C$, $Y \cap C$ is infinite (by the condition of the case), and hence $Z \cap C$ is infinite as well because otherwise there would be a point in $(Y \setminus Z) \cap C$ independent from $Z \cap C$ in $H$, contradicting the maximality of $Z$. Thus we can define a function $g : Y \setminus Z \to Z$ by $g(y) = g_n(y)$, where $n$ is the least such that $g_n(y) \in Z$ and for any $i = 1, \ldots, m$, $g_n(y) \neq T_i(y)$ and $T_i(g_n(y)) \neq y$. Put $G_1 = \{(y, g(y)), (g(y), y) : y \in Y \setminus Z\}$. Also, let $G_2$ be a treeing of $E|Z$ (which exists because $E$ is treeable). Finally, put $G = G_0 \cup G_1 \cup G_2$. Again, it is not hard to check that $G$ is a treeing of $E$ satisfying the condition of the proposition.

**General case:** Let

$$X_1 = \{x \in X : [x]_E \text{ contains only finitely many } G_0^* \text{ classes}\}$$

and put

$$X_2 = X \setminus X_1.$$ 

Then combine the treeings for $E|X_1$ and $E|X_2$ provided by cases 1 and 2.

**Theorem 19.7** (A. Tserunyan). Let $E$ be aperiodic and treeable. Then we have $\mathcal{HTR}_E \subseteq \text{Treeing}(E)$. In particular, if $E$ is hyperfinite, then $\text{Treeing}(E)$ is dense in $\mathcal{TR}_E$.

**Proof.** Fix $G_0 \in \mathcal{HTR}_E$. Since $G_0$ is hyperfinite, we have $G_0^* = \bigcup_{n \geq 1} E_n$, where $E_n$ are increasing and finite. Letting $G_n = E_n \cap G_0$, we get $G_0 = \bigcup_{n \geq 1} G_n$ and thus $G_n \to G_0$. By Proposition 19.6, $G_n$ is in $\overline{\text{Treeing}(E)}$, and hence so is $G_0$.

**Remark 19.8.** Note that Proposition 19.6 cannot be extended to graphs $G_0 \in \mathcal{HTR}_E$, even if we drop the requirement about the $T_i$’s. Indeed, let $E$ be aperiodic, hyperfinite and $F$ a proper aperiodic, hyperfinite subequivalence relation of $E$. If $G_0$ is a treeing of $F$, then it cannot be extended to a treeing $G$ of $E$, since then the cost of $G$ would be bigger than the cost of $G_0$, contradicting the fact that they are both equal to 1.

Let $\text{SubTreeing}(E)$ denote the set of all graphs in $\mathcal{TR}_E$ that are contained in treeings of $E$, i.e.,

$$\text{SubTreeing}(E) = \{G_0 \in \mathcal{TR}_E : \exists G \in \text{Treeing}(E)(G \supseteq G_0)\}.$$
**Proposition 19.9** (A. Tserunyan). Let $E$ be treeable. Then $\mathcal{STR}_E \subseteq \text{SubTreeing}(E)$. Therefore, in particular, we have $\mathcal{HTR}_E \subseteq \text{SubTreeing}(E)$.

**Proof.** Fix $G_0 \in \mathcal{STR}_E$ and let $Y \subseteq X$ be a Borel transversal for $G_0^*$. Since $E$ is treeable, there is a treeing $G$ of $E|Y$. It is clear that $G_0 \cup G$ is a treeing of $E$. \qed

**Proposition 19.10.** Let $G_0 \in \text{SubTreeing}(E)$.

(a) (A. Tserunyan) For any Borel set $A \subseteq X$, $G_0|A \in \text{SubTreeing}(E|A)$.

(b) (C. Conley) For a Borel equivalence relation $F$ with $G_0^* \subseteq F \subseteq E$, $G_0 \in \text{SubTreeing}(F)$.

**Proof.** Let $G \supseteq G_0$ be a treeing of $E$. For (a), project $G$ onto $G|A$ as described in the proof of [JKL, Proposition 3.3 (i)] to get $G' \in \text{Treeing}(E|A)$ such that $G' \supseteq G|A$. Similarly, for (b), use the same method to project $G$ onto $G|C$, for each $F$-class $C$, to get $G' \in \text{Treeing}(F)$ with $G' \supseteq (G \cap F) \supseteq G_0$. One could also note that (a) follows from (b). \qed

**Theorem 19.11** (A. Tserunyan). For any $G_0 \in \text{SubTreeing}(E)$ and automorphisms $T_1, \ldots, T_m \in [E]$, there is a treeing $G \supseteq G_0$ of $E$ such that $A_{T_i,G} = A_{T_i,G_0}$, for all $i$. In particular, $\text{Treeing}(E)$ is dense in $\text{SubTreeing}(E)$ and hence $\text{Treeing}(E) = \text{SubTreeing}(E)$.

**Proof.** Let $X_0$ be the $E$-saturation of $\{x \in X : [x]_{G_0^*} \text{ is infinite}\}$. Then $X_0$ is $E$-invariant and $G_0^*|(X \setminus X_0)$ is a finite equivalence relation, so Proposition 19.6 applies to $G_0||X \setminus X_0)$, and we may assume that $X_0 = X$. Thus each $E$-class $C$ contains an infinite $G_0^*$-class and hence

$$A := \{x \in X : [x]_{G_0^*} \text{ is infinite}\}$$

is a complete section. Note that $B := X \setminus A$ is $G_0^*$-invariant and $G_0^*|B$ is a finite equivalence relation. Let $Y$ be a transversal for $G_0^*|B$ and fix a group $\Gamma = \{g_n\}_{n \in \mathbb{N}} \subseteq [E]$ that generates $E$. Define $g : Y \to A$ by $g(y) = g_n(y)$, where $n$ is the least such that $g_n(y) \in A$ and for any $i = 1, \ldots, m$, $g_n(y) \neq T_i(y)$ and $T_i(g_n(y)) \neq y$ (such $n$ exists since $[y]_E \cap A$ is infinite). Put $G_1 = \{(y, g(y)), (g(y), y) : y \in Y\}$.

We now construct a treeing $G_2 \supseteq G_0|A$ of $E|A$ such that $A_{T_i,G_2} = A_{T_i,G_0}|A$, for all $i$. By (a) of Proposition 19.10, there is $G' \in \text{Treeing}(E|A)$ such that $G' \supseteq G_0|A$. Fix a Borel linear ordering $<$ on $X$ and define a function
for all $i \in T \in G = (F \cup D)$.

Proof. Let $G = G_0 \cup G_1 \cup G_2$ be a (not necessarily treeable) equivalence relation. Then for any $G_0 \in T \in [E]$, there is $G \in MaxTr(E)$ such that $G \supseteq G_0$ and $A_{T_i,G} = A_{T_i,G_0}$, for all $i$. In particular, $MaxTr(E)$ is dense in $T \in [E]$.

Let $G' \in MaxTr(E)$ with $G' \supseteq G_0$ (it exists since, modulo a null set, any increasing wellordered chain stabilizes in countably many steps). Put $F = (G')^*$ and note that $G_0 \in SubTreeing(F)$. Let $S_i \in [F], 1 \leq i \leq m$, be such that $(x,T_i(x)) \in F \implies S_i(x) = T_i(x)$, so that $A_{T_i,H} = A_{S_i,H}$, for any $H \in Gr(F)$. Applying Theorem 19.11 to $F$ and $S_1,\ldots,S_m$ (in lieu of $E$ and $T_1,\ldots,T_m$), we get $G \in Treeing(F)$ such that $G \supseteq G_0$ and $A_{T_i,G} = A_{T_i,G_0}$, for all $i$. It remains to show that $G$ is maximal. Let $G_1 \in T \in [E]$ be such that $G_1 \supseteq G$. Note that because $G$ and $G'$ have the same connected components, $G' \cap (G_1 \setminus G) = \emptyset$ and $G_2 := G' \cup (G_1 \setminus G) \in T \in [E]$. Thus, by the maximality of $G'$, $G_2 = G'$. But $G_2 \setminus G' = G_1 \setminus G$ and hence, $G_1 = G$. 

Let $SubTreeing^*(E)$ denote the set of all graphs in $SubTreeing(E)$ that are not treeings anywhere; i.e.

$SubTreeing^*(E) = \{G \in SubTreeing(E) : \mu(\{x \in X : [x]_E = [x]_{G'}\}) = 0\}$. 

125
**Proposition 19.13** (A. Tserunyan). For any $G \in \text{Treeing}(E)$ and $\epsilon > 0$, there is $G_0 \in \text{SubTreeing}^*(E)$ with $G_0 \subseteq G$ such that $\mu(A_{T,G} \setminus A_{T,G_0}) < \epsilon$, for all $T \in [E]$. In particular, $\text{SubTreeing}^*(E)$ is dense in $\text{Treeing}(E)$.

**Proof.** Let $Y \subseteq X$ be a Borel complete section for $E$ such that $\mu(Y) < \frac{\epsilon}{2}$ (which exists by the Marker Lemma, see [KM, 6.7]) and put

$$G_0 = \{(x,y) \in G : x,y \notin Y\}.$$ 

Clearly $G_0 \in \text{SubTreeing}^*(E)$, and for any $T \in [E],$

$$A_{T,G} \setminus A_{T,G_0} \subseteq Y \cup T^{-1}(Y).$$

Thus $\mu(A_{T,G} \setminus A_{T,G_0}) \leq \mu(Y) + \mu(T^{-1}(Y)) < \frac{\epsilon}{2} + \frac{\epsilon}{2} = \epsilon$. \hfill $\Box$

Theorem 19.11 and Proposition 19.13 together imply:

**Theorem 19.14** (A. Tserunyan). $\text{SubTreeing}^*(E) = \text{Treeing}(E) = \text{SubTreeing}(E)$.
